HREE of our six weeks have passed since we flitted from London. Strasburg, Carlsruhe, Munich, Linz, the Danube, Vienna, Salzburg, Innsbruck, Botzen, and Venice have been stopped at, and, again "going along," we now find ourselves housed in the comfortable Hôtel de la Ville in the beautifully situated Vicenza. Everything has gone well: no time has been lost by misadventure or delay: with sunshine within and out, one fine sight or agreeable event has succeeded another, and the golden chain of travel is jewelled with pleasant memories. A little rhapsody under happy circumstances in such a clime, is more than permissible; the memory and the feelings are alike awakened, and History is made tangible. In the country that cradled the arts, and showed the world the way to freedom, herself not able to retain the blessing, the thoughtful so-

mer feels strikingly at once the power man and his weakness; and thus enthun and melancholy are both evoked. This nza was one of the four great cities of the nese marches (Padua, Treviso, and Verona g the others), that in 1163 formed the first ue against the German Frederick Barbarossa, ch afterwards became the League of Lombardy; mona, Brescia, Mantua, and other towns having ed. The story of the Italian republics is full terest and suggestion, but this is scarcely the e to refer to it. Sismondi has written it well: nd read him. Suffice it here to say the League eeded in a noble struggle against despotism and blished a legal liberty. Then came discords dissolution; corruption, and varied fortunes; quest by the French, and ultimate committal the tender care of Austria, from which the d deliver them!

n 1404 Vicenza yielded to Venice which had reed to extend its frontiers to the Lake of Garda. emorial of the Venetians' long occupancy of city is found in the two columns put up by n in the Piazza dei Signori in imitation of e in the Piazzetta of St. Mark. A fresh lion been recently mounted on one of these columns. Piazza itself is a fine open place, with on one a very lofty thin campanile, and in another the celebrated Basilica, or Palazzo della gione.

alladio, a son of Vicenza, was born in 1518, lived till 1580. One of his earliest works, r long study and many measurements of the s of the ancient world, was the casing, so to k, of this Basilica, the present aspect of which, its two stories of arcades, is known to every hitectural student. The design was chosen in petition with one by Giulio Romano (Giulio 1 in 1546), and has long commanded admiration. It is but a facing; the old Gothic building around which Palladio's arcades stand, still asserts itself, and the necessity for making the points of support in the new work, the piers and columns, agree with those of the old building, was one of the difficulties of the problem submitted to him. The openings, by the way, are over wide for their height, and look weak; the mouldings are admirable. Palladio took more pains in planning the edifices he erected than had been done before his time, and while re-using the old forms, met the wants of modern society. As Quatremere de Quincy correctly says, none of his predecessors in the imitation of the antique hit so happily as he did the *juste milieu* of "correctness without pedantry, severity without rudeness, and liberty without licence." He popularised ancient architecture, so to speak, and created a style which was at once seized on as meeting the views and the wants of the time. We must put ourselves back to his date to appreciate properly his talent. His buildings have been vulgarised by their adoption and repetition all over Europe, and they have led to a great deal of horribly bad architecture. This, however, must not make us unjust to the master. He was an artist of unquestionable ability.

One of the most interesting works left in Vicenza by Palladio is the Olympic Theatre, and this we have taken some pains to illustrate. For the Olympian Academy of Vicenza Palladio had built several temporary theatres in different places for the representation of the ancient drama. At last they determined on erecting a permanent theatre, and Palladio being, of course, commissioned to design it, took the ancient arrangement for his model, with its ranges of seats, one above another, for the audience, and its built-up "scene" with three entrances.* The view of the "scene," with the built-up streets in perspective to give the effect of distance, the plan, and the view of the auditorium, will convey some idea of this curious structure. The depth of the stage from the line of the orchestra to the end of the central street, is about 72 feet, corresponding with the width of the proscenium; a length of about 42 feet of this is on the slant, rising up towards the back. The perspective streets are very cleverly contrived: to light them up for a representation 5,000 little lamps are used. The last time this occurred was in 1857, when the "Orestes" was given. We may add to these statistics that there are ninety-five statues in the interior, thirty-two of them being of stone. The cost is said, on the spot, to have been 80,000 scudi, or 17,000*l.* In 1816 the theatre was restored at the cost of a patriotic citizen, and it is now in a fair state, with the exception of the ceiling, which is about to be renewed. Leaving the "scene" unfinished when he died, some writers affirm that Scamozzi was applied to and finished the theatre, Palladio's son Sylla, who succeeded his father in other works, not having the special knowledge requisite for the undertaking. This, however, is doubtful. Certain it is that the theatre was not finished till four years after Palladio's death: and a tablet over the central arch of the scene bears this inscription:—

VIRTUTI . AC . GENIO .
OLYMPICOR . ACADEMIA . THEATRVM . HOC
A . FUNDAMENTIS . EREXIT
ANN. M.D. LXXXIIII. PALLADIO . ARCHIT.

The numerous palaces erected in Vicenza from the designs of Palladio are mostly in a very bad state of repair. One, the Chiericati Palace, not his best, though some have called it so, has been thoroughly repaired and restored by the town, and is used as the public museum and picture gallery. This building has two orders of columns, one over the other, and in the wings these stand free at some distance from the walls of the building, forming thus a gallery both above and below. In the centre, however, the wall of the building on the upper story is brought out to the line of the columns, and has in it two stories of windows. The effect is very unsatisfactory, as might be imagined. On the staircase are medallion heads of Palladio, Scamozzi, and Calderari, a third architect of note belonging to Vicenza. In one of the apartments there is a collection of original sketches by them, including Palladio's design for the Rialto Bridge in Venice; autograph particulars by him of some of his buildings, filling a dozen large books; and Scamozzi's sketch-book, containing small careful drawings made in France. Many of these memorials were given to the town in 1839, by Gaetano Pinali, a Veronese. The collection of pictures, also chiefly gifts, includes a few good works by the great men of the Venetian school. There is also a very interesting picture by the earliest Venetian painter whose date is obtainable, Maestro Paolo, of Venice. Little else, however, seems to be known about him. Mr. Wornum says only "that an old parchment, illuminated by him bears the date of 1346." The picture to which we refer is an Assumption of the Virgin, dated 1333 (Murray has it 1323), and thus signed,—*Paulus d. Venetiis pixit hō opus.* The soul of the Virgin ascends in likeness of a new-born child, as was not uncommon in the earliest pictures on this theme. Christ, in a vesica, receives it. While, above, Christ in glory, with cruciform nimbus, still holds the swathed *bambino.* The head of the Virgin is admirable; and the sorrow of the angels around beautifully rendered. It is in several respects a remarkable work.

Not far from the basilica a marble statue of Palladio, by Vincenzo Gajassi was erected in 1859. He is represented standing, with part of an ancient capital behind his right foot. The head is good, but the limbs are clumsy. This memorial was presented to his country by Francesco Bressan, and is inscribed simply,—*Andrea Palladio, Architetto.*

Palladio's own house, in the Corso close by, must have had a better effect when the solid portion in the centre of the composition was adorned with a picture, as was probably the case. The front is now anything but pleasing. Vastly superior is the *Casa Pigafetta,* a charming little front whose designer is not recorded. It is dated 1481, and is in style partly Venetian. The balconies and brackets are elaborately sculptured. Under the windows of the ground floor, with carved groups of roses, is this legend:—

IL NEST ROSE SANS ESPINE.

An inscription in French in this neighbourhood is not common. We have given it literally. Of the palaces in the Venetian style, of which a few remain, that of the Conte Schio is the best example. In Vicenza the men of the sixteenth century wiped out much of what had been done before, so that of the Mediæval work comparatively little remains. The Duomo, a fifteenth century building, has a nave of great width, perhaps 60 feet. The choir, of later date, is ascended to by twenty steps, with a landing midway, and nine more steps to the high altar. Externally the east end, constructed of Verona marble, is lofty and good. At times, by the way, the intimation that a building is "of marble" conveys a wrong notion to the English mind; the material being often, when that is the case, rough, stained, and indistinguishable.

In the church of La Santa Corona, also Pointed in style, there is an exquisite picture, by Gian Bellini, of the Baptism of the Saviour by John, with a sculptured altar-piece around it. There are also some admirable Gothic tombs here. The high altar is a remarkable piece of mosaic work, and amongst the remembrances we bring away from the building is that of the head of a monk, carved in wood and coloured, which is fixed up over the door of the sacristy. In this church, we may add, Palladio was buried in 1580, when he died; but his body has been removed, in our own time, to the public cemetery formed outside the city at the northern end, where a costly monument is erected to his honour.

* See pp. 880, 881.

Palladio, in fact, is the crowning memory in the minds of the modern Vicentians.

It is a long, long day's journey by rail from Vicenza to Milan, and needs books, maps, pleasant companions, and a naturally sweet temper, to prevent it from being tiresome. When time does not press, a break at Brescia, with its two cathedrals, churches, and fine pictures, may be wisely made.

On the road, just past Verona, the Lago di Garda comes into view, and at the Desenzano Station, close to Peschiera,—Peschiera being the frontier town between Austrian Italy and Italy proper,—the train stops long enough for travellers to feast hastily on the magnificent view that presents itself. It is in truth a scene of surpassing beauty. The lake of Garda, which bounds three countries, Italy, Tyrol, and Austria, is the most extensive of the Italian lakes. Trees and villages cover the sides; the Island of Sermione and its ruined castle come into the picture. Precipitous hills close it in higher up, with the glorious Tyrolese Alps for back-ground; and on the hot, bright day to which we specially refer, the water was intensely blue, with flashes here and there of vivid green and violet. Nature that morning had spread her palette with the most brilliant colours; and had disposed the senses for keen enjoyment. It was not astonishing to hear an English voice exclaim, hard by, with honest enthusiasm (enthusiasm which had burst out before in a salute to the flag of Italy, then first seen flying), "Oh! Milly, Milly, do look at the water, the mountains, and the sky!" Not soon will that sight of the Lago di Garda be forgotten; though it was but a flash, gone before it was fully seen. Some views, like some words, open the mind to a clearer perception than it had before; and this was one of them.

THE FINANCIAL QUESTION OF THE WORKS IN PARIS.

The *Mémoire* or report presented by the Prefect of the Seine to the Municipal Council of Paris in its ordinary session of 1863, has been published during the week, in the *Moniteur*, and occupies fifteen columns of that official journal. It comprises the account of receipts and expenses for 1862, an estimate of the situation for the year not yet expired, and the scheme of the budget for 1864. Like the reports of previous years, it supplies facts, and draws conclusions from them, in contravention of the exactitude of the imputation against the management of the street improvements and other works, of reducing the number of residences of the smaller class in Paris, and effecting the production of residences of an expensive class alone. To the facts referred to, we could ourselves add others, to show the importance of more careful attention to the general subject than has been given, on this side the Channel, by many who have prognosticated ruin in the finances of Paris, as well as France, from the expenses comprised under public works; and who reason that it is impossible, whatever the objects, for improvements of similar magnitude to be made in London. We do not say that the financial position is clear to us: we merely assert there are facts, known to us as such, which would substantiate assertions of the *Mémoire*, and arguments which our knowledge of the results of neglect in London, might allow us to advance with greater force than that brought to bear by the Prefect of the Seine.

We have made many attempts to show that the improvements in the French capital, include much more than the adornment of the city in street-architecture, and the erection of richly decorated buildings. In the *planning* of through-*routes*, or lines for rapid communication between different quarters of the town, and between the several railway-stations; in the ample provision of public squares and gardens in the heart of Paris, besides that of parks at the outskirts; in the system of sewerage, now nearly completed; and in the arrangements for an abundant water-supply, in active progress, we see the probability of a contrast in the next eight or ten years, as much to our disadvantage in sanitary matters, as it will be in those, the decorative and architectural, which otherwise conduce to the comfort and even health of a population. The principle of planning buildings in *appartements*,—separate residences reached from a common staircase, but each tenement as complete as a house,—that is, planning them from the first, for the manner of their occupation,—we have also shown, is more favourable to domestic comfort and to morality, than the London system, so persisted in, of planning the building for a single family in cases where it is most unlikely to be so occupied; and we have seen a recognition of the views we have expressed, in the somewhat quickened progress in the erection of model dwellings. Also, we some time since showed, that the statements as to the existing deficiencies of Paris, even in the matter of water-supply, contrasted with London, and tested by the rates of mortality, of which we first published a comparison, were by no means borne out; and we could now find in the revelations of the state of Bethnal-green, evidence additional to the point that our metropolis is not in the comparatively fortunate position supposed, and that the neglect and tardiness for which financial grounds have been adduced, are not wise economy on the part of the nation.

We say the nation, because the opinion of a majority in the House of Commons seems to have pronounced against the allotment of national funds to the improvement of the nation's metropolis. It is greatly to be doubted whether the resources of London even, freed from the embargo of protesting vestries, would suffice for the works needed; at least the Metropolitan Board of Works in publishing a list of objects, some time since sought to explain that such was the position.

The Paris improvements are provided for mainly, by resources which do not exist in the case of London, aided however by a contribution from the State. These resources are the *octroi* duties, and money borrowed. It is in reference to the repayment of this money, or the future incidence of the charges for the payment of interest for it, that the unquiet feeling, if any, prevails. Where the principle of contributing by the State is recognized, the State might make up the loss; but every important town in France, and every part of the country and its shores, seems to be engaged on works draining the national exchequer. These however, all, might be met by a change from the policy of the Emperor as exhibited in affairs requiring large military and naval expenditure. If however, funds are capable of being provided through economy, we may question whether that engine of productiveness is not capable of being applied by the Government and Parliament of this country. In a recent number of the *Journal de la Société de Statistique de Paris*, we find prefixed to some forcible arguments on the cost of the "armed peace" of Europe, by Mons. Legoyt, a tabular statement by him, of the army, population, and military expenditure, of each of several countries, with the proportions of military to general expenses, of expenses per soldier, and other particulars. France having a population of 37,500,000, and a total expenditure of 688,645,395 francs, has an effective army of 513,349 men. The United Kingdom, with a population of 29,193,319, contrives to disburse, (unless this careful statistician be less reliable than usual) 677,429,375 francs, having an army of only 300,823 men. Reasons for the great expenditure of this country, which would be suggested to us, we are not here forgetting. The calculation of Mons. Legoyt results in tabulating the French expenditure per soldier as 1,341 francs, and the English as 2,231 francs; and the French military expenses as 33 per cent. of the total expenses, whilst ours as 39 per cent. The French appear from the same authority to have 1 soldier to every 73 inhabitants, whilst we have 1 to 97. It is obvious from such figures, that a reduction of armaments would get rid of any financial difficulty about public works, in either country.

The present question however relates to the sufficiency of such calculations as those of the Prefect of the Seine, on the basis of existing things and probabilities; and here we can only direct the attention of readers to the importance of considerations which we have alluded to, and not now attempt further investigation. Those who are on the spot do not seem to be in a better position than we are. We have endeavoured to inform ourselves of every argument that has been adduced in France, for the last two or three years, against the municipality; but have found the arguments, one after another, contradicted by facts adduced in reports such as the one now under notice. Even supposing it be admitted that the great increase of *logements*, or residences, has been provided in the former suburbs, now annexed to Paris, it must be recollected that the distance from these localities to the centre, is not great, as it is in London, and that much has been done to provide them with direct connecting *routes* to the heart of the city. Omnibuses are numerous; and an outside seat costs three *sous*.

The *Mémoire* of the Prefect shows that the total receipts of 1862 were 175,712,567 *francs* 90 *centimes* (about 7,028,503*l*.). The expenses were 165,888,899 *francs* 49 *centimes* (6,635,556*l*.). Thus there was a balance left in hand of 9,823,668 *francs* 41 *centimes*. Was this balance made up of money that had been borrowed? It is estimated that the balance in hand this year will be 12,685,743 *francs* 27 *centimes*. The budget for 1864, figures the receipts as 151,408,942 *francs* 7 *centimes*, and the expenses as the same in amount. Each of these is composed of several kinds of items thus:—

	Receipts. francs. c.		Expenses. francs. c.
Ordinary	123,945,812·07	....	81,881,975·90
Extraordinary	10,625,500·00	....	52,689,336·17
Supplementary	15,500,500·00	....	15,500,000·00
Special	1,337,630·00	....	1,337,630·00
Total	151,408,942·07	....	151,408,942·07

Mr. A. Darimon, in noticing this report, in *La Presse*, says that the method followed by Monsieur Haussman, has the advantage of offering under each head, information which is of great value in more respects than one, but that it has the inconvenience of impeding a comprehensive view of the finances of the city. From the infinity of details which are presented, there is a resulting obscurity from which the reader does not readily disengage himself. He says that attentively to read the exposition of the finances of Paris is a labour which is almost repulsive; what is it then, he asks, to understand them? He thinks it would cost nothing, to give more clearness to the statement, and that this is especially necessary in a city which has not an *elected* municipal council. We apprehend the same form would express the opinion of many others. The accounts are not understood; they may, or may not, be wrong; only, those who have thought them wrong have made mistakes in some of their statements.

Mons. Haussmann dwells upon the circumstance of the annexation of the suburban communes having troubled the finances temporarily, through expenditure required in excess of the receipts. A main point advanced to show that the small tenements have not been suppressed, is that of an increase in the number of total or partial exonerations from certain taxes. These exonerations are graduated from 250 *francs* (10*l*.) to 1,500 *francs* (60*l*.), of *imposable* rent, or 312 *francs* 50 *centimes* to 1,875 *francs* of real rent; and there will be 4,011 total, and 639 partial, exonerations more in 1864 than in 1863.

Great exertions are being made in France, to improve and extend primary education, or to get the Government to take steps to that effect. Of these exertions we may one day speak. But the city of Paris appears to recognize its obligations. The elementary instruction, with the maintenance of buildings, will cost Paris 4,223,007 *francs* (over 168,920*l*.) in 1864. At present, the number of schools belonging to the city is 448 (providing for 88,704 scholars), besides 17 free schools. Forty-six new scholastic establishments are about being opened. They include two special schools of design for women.

Surely, the Prefect of the Seine and the Emperor need but to tell the whole truth, without mystification, and rely upon the spirit of France,—in this sense indeed, "rich enough to pay for her *glory*." Let London, and this country, seek to learn even in sanitary matters, from what the French are doing. There is money-value in the results.

WHAT WE FIND IN THE SMITHFIELD CLUB SHOW.

In the olden time men scarcely understood the easy means of communication are to a land what the circulation of the blood is to the individual. Inter-exchange, whether of goods or of thought, were then always difficult and expensive, and sometimes impossible. The intermittent activity of the great meetings, of which the country fair is a feeble remaining vestige, are now superseded by the continuous and healthy flow of modern intercourse. While the Mediæval "fair," properly so called, is thus obsolete, at any rate in England, the many local and peripatetic shows fostered by our agricultural societies are blooming with perennial vigour. The reason is obvious: agriculture is in a state of transition. The great modern revolutionist, steam, is making its impress on the land. All great changes must be gradual to be enduring; and the agriculturist comes to these shows, sometimes with the intention of buying, but always with that of learning. W

can only get at truth by comparison; and to commercial goodness by competition; and to the emulation brought into play by these shows are partly due the late rapid strides of agricultural engineering. Whether the accounts given by the attendants at the different stands are not to be taken *cum grano salis*; whether, in fact, the love of veracity of agricultural engineers has been as much improved by these shows as their engines, are questions we leave to be decided by the moral philosopher.

The arts of peace are all more or less allied; while the demands of agriculture upon mechanical ingenuity have been so many and so varied, that more than one operation in the building trade has been facilitated by mechanical arrangements originally intended for agriculture alone. The extended and daily increasing use of the portable engine by builders and contractors is one of these importations from agricultural engineering. Many other machines could be used in building, and to the exhibits belonging to our vocation that we noticed in the Islington Agricultural Hall, we propose to confine our attention.

By a somewhat thoughtless piece of mismanagement on the part of the Club, several noted exhibitors,—such as Clayton & Co., of brickmaking machine notoriety; and Clinton & Owens, the hydraulic engineers,—were absent from the show. Last year, the 1st of November was fixed upon as the last day for entering the things to be exhibited. With no previous notice to this effect, the last day of application to exhibit was advanced by a month. Many intending exhibitors were thus unconsciously too late.

Foremost in every exhibition of this kind are, of course, the portable engines, and this year's Smithfield Club Show forms no exception. The number of portable engines at work in England alone cannot be estimated under 6,000. It is within our own knowledge that a single firm,—Clayton & Shuttleworth, of Lincoln,—have turned out as many as 5,500 engines of this description. Many of these engines have been, of course, made for the export trade. Messrs. Clayton & Shuttleworth exhibited at the show which closed yesterday (Friday) seven portable engines, varying from 4-horse power to 12-horse power nominal. The excellent design of these engines undoubtedly accounts for their unexampled success with English and foreign purchasers.

The workmanship, details, and general arrangement are only inferior to the best class of locomotive work. The strong and elegant hollow crank-shaft brackets, the well-proportioned connecting-rod, the adjustible slide-blocks and crank-shaft bearings, besides other details, make this engine the best in the trade, and a model for the exercise of the imitative faculties of the smaller makers. A larger importation, however, of recent locomotive design, would distance these rivals. To make the firebox flush with the boiler, at the same time giving extra steam-space to the barrel, in order to prevent priming; to forge and cast the oil-cups on the connecting-rods, and the eccentric straps respectively; to counterbalance the reciprocating parts by a strip cast on the fly-wheel, would be improvements that we hope to see carried out on the Stamp End engine. But few of the other agricultural engines are worthy any criticism. When we see such mechanical monstrosities and antiquities as the use of "classical" pillars to carry a crank-shaft; round slide-bars, long ago condemned for the purpose by their inapplicability to a lateral strain; a double crank placed in the exact centre between the two brackets, and thus far away from any bearing; a connecting-rod crosshead screwed on a piston-rod; a fly-wheel pulley placed on the side furthest from the crank; firebox-stays with countersunk heads, — without completing our roll of indictment, we are compelled to assume, that making horse-ploughs and thrashers is not a good preparation for designing steam-engines.

A form of the steam-engine destined to be of great importance to the building trades, is that of the traction, or self-propelling engine. In many situations the use of a steam-engine that could be used as required, for conveying materials, for sawing, for hoisting, and other operations, would be a fortune in itself. It is to be hoped that the absurd regulations of Sir George Grey, with respect to traction engines, will be sooner or later repealed. If horses can be taught to stand fire, they can be taught to pass an engine without starting. A great impulse to the use of these engines is, however, due to the demand for a self-propelling engine in steam ploughing. Substantially, these light traction engines are simply portable engines, furnished with either gearing or a pitch chain—generally the latter—communicating motion to the pair of hind wheels; and the whole provided with an arrangement for steering. Of course, many other minor accessories are required to adapt a portable engine to the road; but the above are the main features of this class of engine. The traction engine is not a novelty. Many engineers, amongst whom we may reckon Mr. Scott Russell, have attempted to place steam on common roads. Mr. Hancock was very successful in this way, as will be remembered by some of our older readers. The union of the wheel and the rail, however, soon stifled all these attempts, and it has needed the introduction of steam-ploughing, and the daily increasing application of steam for all purposes, to revive the use of steam on common roads. Without much considering what had been previously achieved, a very large number of clumsy and even ridiculous designs for traction engines have been put forward at these agricultural shows. The engine, the construction of which witnesses to a thorough appreciation of its intended purpose, is that of Messrs. Aveling & Porter, of Rochester. The engine is driven by a strong steel pitch-chain, and, as the chain wears, the slack is taken up by setting the counter-shaft, which turns on a pair of adjustible gun-metal bearings, working in radial slots. The steering apparatus simply consists of a single steering and carrying wheel, caused to swivel by the steersman in front, at the end of a light wrought-iron frame fixed to the front end of the smoke-box. Our limits forbid us to enlarge further upon this excellent form of traction-engine; but we may state that we have seen one of these engines drag 20 tons up an incline of 1 in 8, at a speed of about 2 miles an hour. We believe that no less than ninety have been already made at Rochester for the home and export trade.

At Messrs. Brown & May's stand we noticed a mill for crushing cement, flint-stone, and similar substances. It is upon what might be called an absurdly simple plan, but, like most simple machines, it is remarkably efficient and cheap. A pair of rollers are fitted with a frame; in the more powerful machines, two pairs, placed one above the other, are used. These rollers—of chilled cast iron — are cast with alternate V grooves, the V's or projections of one roller working into the projections of the roller opposite, thus, ΛV. One roller is driven at a different speed to the other. We understand that the veteran engineer, the well-known Mr. Richard Roberts, took a great interest in this simple machine.

At stand No. 1 was exhibited a model of a curious plan for raising, lowering, and transporting goods to and from a warehouse. The idea seemed to be taken from Mr. Fowler's steam ploughing tackle. Two strong wire ropes, or chains, are stretched on pulleys, at an angle between the warehouse, and, for instance, a vessel lying alongside a quay. The goods to be transported are suspended from this endless rope, and are moved to and fro as required by means of one of the pulleys being driven by steam or other power. Whether the rope will not have a tendency to slip out of the pulleys through the down strain, is a question to be determined by actual trial. For light weights this plan may be very useful in some situations; but the down pull must clearly be very heavy on the centre of the long endless rope used in this arrangement.

As was natural, a great variety of fencing was exhibited. W. S. Underhill's fence (stand No. 13) is formed out of broad horizontal bars, with slits or notches for the upright rods to pass through—an ingenious plan, likely to make a very cheap and strong kind of fencing. Hill & Smith (stand No. 117) exhibited various fences formed with hollow galvanized plate-iron pillars, and strongly strained where required by a worm and wheel. Our contemporary, *Punch*, alluded a week or two ago to the annoyance to fox-hunters caused by wire fences. *Punch* recommends that wire fences should be taken up and replaced every year. We doubt whether farmers will follow his advice. Apart from the expense of the proceeding, the bundle of wires would untwist and get ruined while lying on the ground, and the fence would not merely have to be again erected, but would have to be perhaps replaced.

A simple rotary screen, on wheels, for screening gravel, formed of iron rods placed parallel to the axis of the machine, was also to be seen at this stand. The mesh was $\frac{5}{16}$ in., but every alternate rod could be taken out to increase the mesh for coarse work.

The last-mentioned stand was in the galleries. Continuing our tour round these, we noticed that Mr. A. B. Childs, one of the principal exhibitors in this country of American mechanical "notions," exhibited a useful implement, "a post-hole auger," a tool said to "combine all the advantages of the shovel, spade, and post-spoon," in the operation of digging holes for erecting posts. It was formed like a wood auger on a large scale; and, furnished with a long handle, it can be lifted out of the ground, thus bringing up the soil, and leaving a clean round hole. We also noticed a pick-axe, formed without an eye. An iron socket is fixed on the handle of the pick, into which it slips, and is keyed fast by a key or wedge. This pick is stated to be used by the Federal armies. An ingenious American log sawing-machine was also shown at this stand. The saw in this machine is worked by a simple contrivance,—scarcely, however, to be made clear without a drawing. The saw while reciprocating is enabled to radiate, and to thus adapt itself to the progress of the work.

We noticed another American invention that has enjoyed some success in England. It is that of the ingenious form of a pump, known under the name of "California Pump." The chief peculiarity and advantage of this pump consist in its valves being very easily accessible. The barrel is placed horizontally, the valves are above, and by taking off the air vessel on the top of the latter, ready access is obtained to the whole.

The well-known deferential pulley-blocks patented under the name of Weston, were shown by several exhibitors. These pulley-blocks are on the principle of what has been known for many years as the "Chinese windlass;" viz., an axis, on which are fixed two cylinders of different diameters: when the axis revolves, one end of a cord is coiled round (say) the larger cylinder, while the other end is uncoiled from the smaller cylinder. The contrivance in this shape has not been used in practice, from the very great quantity of rope required. The improved apparatus patented by Mr. Weston was completely described—as was lately pointed out by a correspondent to a contemporary,—some twenty years ago, in a work on Mechanics. It is also stated that the contrivance in its perfected shape was noticed on a drawbridge at Pekin, during the late occupation of that city by the Anglo-French forces. Instead of using a rope, an endless chain is applied to teeth cast on a double sheave of two different diameters. The weight would necessarily remain stationary if the chain passed over sheaves of equal diameters; but one sheave being of a larger diameter, it takes up more chain, and the weight is raised in the same proportion. The objection to this contrivance is, that it cannot be well applied in situations where the loads vary considerably, as the speed of the apparatus can never be much quickened with a smaller weight. Its great advantage consists in the perfect freedom from the danger of running down; and no doubt builders might use it oftener than is at present the case.

Amongst a number of these pulleys, and in company with such useful domestic articles as "perpetual automaton mouse-traps" and patent sausage-making machines, exhibited by Messrs. S. & E. Ransome, we noticed a novel form of hand-truck, for conveying sacks or bales. It is not easy to push an ordinary hand-truck under a heavy bale; the loose wheels have a tendency to roll the barrow back. This is prevented in Mr. Wilmott's contrivance by fitting a simple form of self-acting locking gear to the axle. The ordinary axle is fitted with a pair of cogs on each side, and, kept out of gear from the cogs by means of a spring, is placed a bar. The pressure of the foot causes this bar to lock into the wheels: its removal allows the wheels to roll as usual.

Mr. Sawney (stand No. 101) exhibited a very neatly arranged grindstone,—fixed on a wrought-iron framing and worked by a treadle,—likely to be of use to some of our readers.

Moore's ingenious ventilators were shown at Stand No. 84. These ventilators, as our readers know, can be easily applied to stained-glass church windows.

Different kinds of apparently excellent roofing felts, stable fittings, hydropults, and similar exhibits, were also to be seen in the gallery.

IRON-WORKERS AND TOOL-MAKERS.*

CORT—MUSHET—NASMYTH.

WHEN a Frenchman in conversation with Sir John Sinclair praised the artist who invented ruffles, the baronet shrewdly remarked that some little merit was also due to the man who added the shirt. The ornamental ought ever to be based on the useful. Without derogating from the bio-

* Industrial Biography: Iron-workers and Tool-Makers. By Samuel Smiles. London: Murray. 1863.

graphic claims of those who minister to taste and intellect, those who minister to utility need not be overlooked. It is true that taste and ornamental display may be admitted to rank in some respects a little higher in the scale of civilization than mere utility; which may, therefore, in these respects, be looked down upon as of a more *basal* though not of a *baser* order. But we are not going to admit the inferiority, in any one essential point, of utility to beauty, even as a token of advancement in civilization. Not unfrequently it is useless ornament, and beauty in trifles, which attract the eye and please the taste of the savage rather than things of solid utility. Yet this is not always the case. When Captain Cook and the early navigators first sailed into the South Seas, old nails and old hoops soon rose to a high premium; an old anchor which accidentally turned up became a mass of bullion in the bank, and represented an immense equivalent of provisions and other valuables. Who were the more really savage,—these poor but sensible islanders, or those great discoverers of America who committed such dreadful excesses for the sake of that gold which the Mexicans and Peruvians comparatively despised?

We not only rank our iron-workers and our tool-makers as a most useful order of men, but as men of a high rank in civilization. It is to these very men indeed, that England owes its present greatness as a civilized nation. It is upon *their* shirt that the ruffles have been stitched.

Mr. Smiles, while preparing his "Lives of the Engineers," came frequently across the tracks of celebrated inventors, mechanics, and iron-workers,—the founders, in a great measure, of the modern industry of Britain,—whose labours seemed to him well worthy of being traced out and placed on record; and the more so as their lives presented many points of curious and original interest. By the help of various contributions from eminent living and lately deceased mechanical engineers, he has just produced another interesting, though not unassailable volume; the saleable merits, at least, of which new issue may be judged of by the fact that the London booksellers alone purchased ten thousand copies of it before it was published.

The work is divided into sixteen chapters, the headlines of which are as follows:—Iron and Civilization; Beginnings of the Iron Manufacture in Great Britain; Iron Smelting by Pit-Coal—Dud Dudley; Andrew Yarrington; Coalbrook Iron-works—The Darbys and Reynoldses; Invention of Cast-Steel—Benjamin Huntsman; The Inventions of Henry Cort; The Scotch Iron Manufacture—Dr. Roebuck—David Mushet; Invention of the Hot Blast—James Beaumont Neilson; Mechanical Inventions and Inventors; Joseph Bramah; Henry Maudslay; Joseph Clement; Fox, of Derby—Murray, of Leeds—Roberts and Whitworth, of Manchester; James Nasmyth; and William Fairbairn.

It is not easy to select from these biographical sketches those of most interest; for all are interesting; but, being desirous of gleaning a few weighty heads from Mr. Smiles's abundant sheaf, we shall select—say Cort, Mushet, and Nasmyth, as the names to which we shall restrict our attention. We shall leave others to point out the weaknesses of the book.

Henry Cort was born in 1740, at Lancaster, where his father carried on the trade of a builder and brickmaker. Nothing is known of Henry's early history; but he seems to have raised himself by his own efforts to a respectable position. In 1765 we find him established in Surrey-street, Strand, carrying on the business of a navy agent, in which he is said to have realized considerable profits. It was while conducting this business that he became aware of the inferiority of British iron compared with that obtained from foreign countries. The English wrought-iron was considered so bad that it was prohibited from all Government supplies, while the cast-iron was held to be of too brittle a nature to be suited for general use. Indeed, the Russian Government became so persuaded that the English nation could not carry on their manufactures without Russian iron, that in 1770 they ordered the price to be raised from 70 and 80 copecs per pood to 200 and 220 copecs per pood. The Russian's greed was great but his sense was small; for he thereby stimulated the inventive genius of Cort, and laid the solid foundations of England's greatness as the iron workshop of the world. As in other inventions, Cort took up the manufacture of iron at the point to which his predecessors had brought it; standing on their shoulders, as it were, and seeing over their heads; improving upon their processes and carrying their discoveries still farther afield. Cort published his patents in 1783 and 1784. In dispensing with the blast, he had been anticipated by the Craneges, and in the process of puddling by Onions; but he introduced so many improvements of an original character, with which he combined the inventions of his predecessors, as to establish quite a new era in the history of the iron manufacture; and, in the course of a few years, to raise it to the highest state of prosperity. As early as 1786, Lord Sheffield recognised the great national importance of Cort's improvements in the following words:—"If Mr. Cort's very ingenious and meritorious improvements in the art of making and working iron, the steam-engine of Boulton & Watt, and Lord Dundonald's discovery of making coke at half the present price, should all succeed, it is not asserting too much to say that the result will be more advantageous to Great Britain than the possession of the thirteen colonies [of America]; for it will give the complete command of the iron trade to this country, with its vast advantages to navigation." It is scarcely necessary here to point out how completely the anticipations of Lord Sheffield have been fulfilled, sanguine though they might appear to be when uttered some seventy-six years ago.

We cannot here discuss the merits, or even recapitulate the details, of Cort's inventions of puddling and rolling iron, and must hasten to the sad end of his story. Everything seemed to be getting on swimmingly with him for a time. He was patronised by the Admiralty, and the merits of his inventions were generally conceded. Numerous contracts for licenses were entered into with Cort and his partner, Mr. Jellicoe, by the manufacturers of bar-iron throughout the country. Cort himself made arrangements for carrying on the manufacture on a large scale, and with that object entered upon the possession of a wharf at Gosport, belonging to Adam Jellicoe, his partner's father, where he succeeded in obtaining considerable Government orders for iron made after his patents. To all ordinary eyes the inventor now appeared to be on the high road to fortune; but there was a fatal canker at the root of this seeming prosperity, and in a few years the fabric which he had so laboriously raised crumbled into ruins.

On the death of Adam Jellicoe, who was a Government *employé*, defalcations were discovered in his public accounts to the extent of 39,676*l.*, and his books and papers were immediately taken possession of by the Government. On examination it was found that the debts due to Jellicoe amounted to 89,657*l.*, included in which was a sum of not less than 54,853*l.* owing to him by the Cort partnership. In the public investigation which afterwards took place, it appeared that the capital possessed by Cort being insufficient to enable him to pursue his experiments, which were of a very expensive character, Adam Jellicoe had advanced money from time to time for the purpose, securing himself by a deed of agreement entitling him to one-half the stock and profits of all his contracts; and in further consideration of the capital advanced by Jellicoe beyond his equal share, Cort subsequently assigned to him all his patent rights as collateral security. As Jellicoe had the reputation of being a rich man, Cort had not the slightest suspicion of the source from which he obtained the advances made by him to the firm; nor has any connivance whatever on the part of Cort been suggested. At the same time it must be admitted that the connexion was not free from suspicion; and, to say the least, it was a singularly unfortunate one.

The result was that the assignments of Cort's patents, which had been made to Jellicoe in consideration of his advances, were taken possession of; but Samuel Jellicoe, the son of the defaulter, singular to say, was put in possession of the properties at Fontley and Gosport, and continued to enjoy them, to Cort's exclusion, for a period of fourteen years. It does not, however, appear that any patent right was ever levied by the assignees; and the result of the proceeding was that the whole benefit of Cort's inventions was thus made over to the ironmasters and to the public. Had the estate been properly handled, and the patent rights due under the contracts made by the ironmasters with Cort been duly levied, there is little reason to doubt that the whole of the debt owing to the Government would have been paid in the course of a few years.

In a report made by commissioners to the Houses of Parliament in 1805, the value of Cort's patents was estimated at 100*l.*! Referring to the schedule of Jellicoe's alleged assets, they say, "Many of the debts are marked as bad; and we apprehend that the debt from Mr. Henry Cort, not so marked, of 54,000*l.* and upwards, is of that description." As for poor bankrupt Henry Cort, these discussions availed nothing. On the death of Jellicoe, he left his ironworks, feeling himself a ruined man. He made many appeals to the Government of the day for restoral of his patents, and offered to find security for payment of the debt due by his firm to the Crown, but in vain. In 1794 an appeal was made to Mr. Pitt by a number of influential members of Parliament, on behalf of the inventor and his destitute family of twelve children, when a pension of 200*l.* a-year was granted him. This Mr. Cort enjoyed until the year 1800, when he died, broken in health and spirit, in his sixtieth year. He was buried in Hampstead churchyard, where a stone marking the date of his death is still to be seen. A few years since it was illegible, but it has recently been restored by his surviving son.

"Though Cort," says Mr. Smiles, "thus died in comparative poverty, he laid the foundations of many gigantic fortunes. He may be said to have been in a great measure the author of our modern iron aristocracy, who still manufacture after the processes which he invented or perfected, but for which they never paid him a shilling of royalty. These men of gigantic fortunes have owed much—we might almost say everything—to the ruined projector of 'the little mill at Fontley.' Their wealth has enriched many families of the older aristocracy, and has been the foundation of several modern peerages. Yet Henry Cort, the rock from which they were hewn, is already all but forgotten; and his surviving children, now aged and infirm, are dependent for their support upon the slender pittance wrung by repeated entreaty and expostulation from the state."

David Mushet was born at Dalkeith, near Edinburgh, in 1772. Like other members of his family he was brought up to metal founding. At the age of nineteen he joined the staff of the Clyde ironworks, near Glasgow; and here, though acting merely as an accountant, he practised assaying, and became so skilled in it that he was consulted in difficulties; but at length the manager, whether from envy, caprice, or because Mushet might thereby be *idling* away his time as an accountant, ordered his furnaces to be pulled to pieces. Elsewhere, however, he quietly erected new ones for himself, and continued his experiments even while he remained at the Clyde works. Afterwards he became a partner in the Calder ironworks, which he and his partners erected. About this time (1801) he made the discovery of the celebrated black band ironstone by means of his assaying skill; and great prejudice was excited against him by the ironmasters and others of that day in presuming to class the *wild coals* of the country (as Black Band was called) with ironstone fit and proper for the blast furnace. Yet that discovery has elevated Scotland to a considerable rank among the iron-making nations of Europe, with resources still in store that may be considered inexhaustible.

"But such," he himself remarks, "are the consolatory effects of Time, that the discoverer of 1801 is no longer considered the intrusive visionary of the laboratory, but the acknowledged benefactor of his country at large, and particularly of an extensive class of coal and mine proprietors and iron masters, who have derived, and are still deriving, great wealth from this important discovery: and who, in the spirit of grateful acknowledgment, have pronounced it worthy of a crown of gold, or a monumental record on the spot where the discovery was first made.

At an advanced period of life, such considerations are soothing and satisfactory. Many under similar circumstances have not, in their own lifetime, had that measure of justice awarded to them by their country to which they were equally entitled. I accept it, however, as a boon justly due to me, and as an equivalent in some degree for that laborious course of investigation which I had prescribed for myself, and which, in early life, was carried on under circumstances of personal exposure and inconvenience, which nothing but a frame of iron could have supported. They atone also, in part, for that disappointment sustained in early life by the speculative habits of one partner, and the constitutional nervousness of another, which eventually occasioned my separation from the Calder Ironworks, and lost me the possession of extensive tracts of black band ironstone, which I had secured while the value of the discovery was known only to myself."

Among the other important results of Mr. Mushet's lifelong labours, the following may be summarily mentioned:—The preparation of steel from bar-iron by a direct process, combining the iron with carbon; the discovery of the beneficial effects of oxide of manganese on iron and steel; the use of oxides of iron in the puddling-furnace in various modes of appliance; the production of pig-iron from the blast-furnace, suitable for puddling, without the intervention of the refinery; and the application of the hot blast to anthracite coal in iron-smelting. For the process of combining iron with carbon for the production of steel, Mr. Mushet took out a patent in 1800; and many years after, when he had discovered the beneficial effects of oxide of manganese on steel, Mr. Josiah Heath founded upon it his celebrated patent for the making of cast-steel, which had the effect of raising the annual production of that metal in Sheffield from 3,000 to 100,000 tons. His application of the hot blast to anthracite coal,

after a process invented by him and adopted by the Messrs. Hill, of the Plymouth Ironworks, South Wales, had the effect of producing savings equal to about 20,000*l.* a year at these works; and yet, strange to say, Mr. Mushet himself never received any consideration for his invention.

While he lived, Mr. Mushet was a leading authority on all matters connected with iron and steel, and he contributed largely to the scientific works of his time. He died in 1847.

James Nasmyth belongs to a family whose genius in art has long been recognised. His father, Alexander Nasmyth, of Edinburgh, was a landscape painter of great eminence, whose works are sometimes confounded with those of his son Patrick, called the English Hobbema, though his own merits are peculiar and distinctive. The elder Nasmyth was also an admirable portrait-painter, as his head of Burns—the best ever painted of the poet—bears ample witness. His daughters, the Misses Nasmyth, were highly skilled painters of landscape, and their works are well known and much prized. James, the youngest of the family, inherits the same love of art, though his name is more extensively known as a worker and inventor in iron. He was born at Edinburgh on the 19th of August, 1808; and his attention was early directed to mechanics by the circumstance of this being one of his father's hobbies. Amongst the visitors at his father's studio were Professor Leslie, Patrick Miller, of Dalswinton, and other men of distinction. The elder Nasmyth assisted Mr. Miller in his early experiments with paddle-boats, which eventually led to the invention of the steamboat. It was a great advantage for the boy to be trained by a father who so loved excellence in all its forms, and could minister to his love of mechanics by his own instruction and practice. James used to drink in with pleasure and profit the conversation which passed between his father and his visitors on scientific and mechanical subjects; and as he became older, the resolve grew stronger on him every day that he would be a mechanical engineer, and nothing else.

His first essay at making a steam-engine was when he was only fifteen years old. He then made an actual working engine, 1¼-inch diameter cylinder, and 8-inch stroke, which not only could act, but did some really useful work, for he made it grind his father's oil colours. He afterwards made many models to order; and some friends having supplied him with money he built, at a cost of 60*l.*, in 1828, a steam carriage, which ran many a mile with eight persons on it. Afterwards he sold it, and the engine was used in driving a small factory. In this engine, Mr. Nasmyth states that he used the waste steam to increase the draught through the chimney, not aware that George Stephenson had some years before made the same vitally important discovery. The summit of Nasmyth's ambition was to get into Maudslay's establishment in London; but as his father could not pay a premium, the lad created his own premium in the shape of a small steam-engine, every part of which was the result of his own handiwork, including the casting and the forging of the whole. With this he went hopefully to London in a Leith smack, which took eight days on its voyage. The engine was exhibited to Henry Maudslay, and Nasmyth was at once appointed to act as Maudslay's own private workman, at a salary modestly fixed by Nasmyth himself, at 10s. a week, out of which he had to pay 3s. for lodging. He contrived a small cooking apparatus, however; and managed, he says, to keep the eating and drinking department within 3s. 6d. a week. "I have the old apparatus by me yet," he says, in 1862, "and I shall have another dinner out of it ere I am a year older, out of regard to days that were full of the real romance of life." In a brief sketch written by himself, from which we quote, Mr. Nasmyth gives the following rapid note of his subsequent career:—

"On the death of Henry Maudslay in 1831, I passed over to the service of his worthy partner, Mr. Joshua Field, and acted as his draughtsman, much to my advantage, until the end of that year, when I returned to Edinburgh, to construct a small stock of engineering tools for the purpose of enabling me to start in business on my own account. This occupied me until the spring of 1833; and during the interval I was accustomed to take in jobs to execute in my little workshop in Edinburgh, so as to obtain the means of completing my stock of tools. In June, 1834, I went to Manchester, and took a flat of an old mill in Dale-street, where I began business. In two years my stock had so increased as to overload the floor of the old building to such an extent that the landlord, Mr. Wrenn, became alarmed, especially as the tenant below me—a glass-cutter—had a visit from the end of a 20-horse engine beam one morning among his cut tumblers. To set their anxiety at rest, I went out that evening to Patricroft and took a look at a rather choice bit of land bounded on one side by the canal, and on the other by the Liverpool and Manchester Railway. By the end of the week I had secured a lease of the site for 999 years: by the end of the month my wood sheds were erected: the ring of the hammer on the smith's anvil was soon heard all over the place, and the Bridgewater Foundry was fairly under way. There I toiled right heartily until December 31st, 1856, when I retired to enjoy in active leisure the reward of a laborious life, during which, with the blessing of God, I enjoyed much true happiness through the hearty love which I always had for my profession; and I trust I may be allowed to say, without undue vanity, that I have left behind me some useful results of my labours in those inventions with which my name is identified, which have had no small share in the accomplishment of some of the greatest mechanical works of our age."

If Mr. Nasmyth had accomplished nothing more than the invention of his steam-hammer, it would have been enough to found a reputation.

The history of this hammer is an interesting and instructive one. In 1838, the engineer of the company who were about to build the *Great Britain*,—the first of the big ships,—wrote to Nasmyth, complaining that there was not a forge hammer in existence powerful enough to forge the paddle-shaft of the engine; and asking Nasmyth what he should do: did he think he might dare to use cast iron? Instantly the idea of the steam-hammer flashed into Nasmyth's mind; and, in a few minutes, a sketch of it was on paper. Mr. Brunel and others heartily approved of it; but the paddle-shaft for which it was so promptly invented never was forged at all: the screw was then attracting attention, and was adopted in preference to the paddle; and the steam-hammer was left to bide its time, in the hands of him whose ancient family *arms*, strange to say, were a sword between two hammers, with broken shafts, and the motto "Non Arte sed Marte;" the founder of the family, at least under the name of Naesmyth, having taken refuge, on some political emergency, in a smith's shop, and set to work so awkwardly with the smith's hammer, that it became manifest at once to his enemies, "the Douglas men," that he was "nae smyth," and he had to show them that he was at all events a swordsman, and fairly routed the Douglas men. The king bestowed a grant of land on his follower who was Nae Smyth, and he then assumed the armorial bearings just spoken of. When the steam-hammer became a power in the world, Nasmyth, by a remarkable antithesis, reversed the motto of the family into "Non Marte sed Arte," and displaced the sword and the broken hammers, for which his own magnificent steam-hammer was substituted. A more curious heraldic anecdote, we are sure, was never told.

Many unsuccessful attempts were made to introduce the steam-hammer. No forge master would take it up. The inventor wrote in vain to all the great firms, urging its superiority to every other tool for working malleable iron into all kinds of forge work. His own partner, Mr. Gaskell, at Patricroft, declined to have anything to do with it, or even to assist him to patent it. An intelligent Frenchman, M. Bourdon, came, upon one occasion, to Patricroft, to purchase tools; and among other things incidentally shown to him by Mr. Gaskell was Nasmyth's sketch of his steam-hammer, which Mr. Gaskell, however, never once thought of even mentioning to Nasmyth (who was absent at the time) that he had done. In 1840, Mr. Nasmyth happened to take a trip to France, and called upon his customer, M. Bourdon. In passing through his works at Creusot, just as M. Bourdon had done at Patricroft, Nasmyth happened to see a great crank shaft, not only forged in the piece, but punched. Wondering, Nasmyth asked him how he got that shaft forged. "Why, with your own hammer, to be sure!" said M. Bourdon. Great indeed was Nasmyth's astonishment; for he had never yet seen his own hammer, except in his own sketch; nor had he ever been told that M. Bourdon knew anything about it.

"M. Bourdon said he had been so much struck with the ingenuity and simplicity of the arrangement, that he had no sooner returned than he set to work, and had a hammer made in general accordance with the design Mr. Gaskell had shown him; and that its performances had answered his every expectation. He then took Mr. Nasmyth to see the steam-hammer; and great was his delight at seeing the child of his brain in full and active work."

On reaching England, Mr. Nasmyth at once wrote to his partner telling him what he had seen, and urging that the taking out of a patent for the protection of the invention ought no longer to be deferred. But trade was still very much depressed; and as the Patricroft firm needed all their capital to carry on their business, Mr. Gaskell still objected to lock any of it up in engineering novelties. Seeing himself on the brink of losing his property in the invention, Mr. Nasmyth applied to his brother-in-law, Mr. William Bennett, who advanced him the requisite money for the purpose — about 280*l.*, — and the patent was secured in June 1840.

"The first hammer, 30 cwt., was made for the Patricroft works, with the consent of the partners; and in the course of a few weeks it was in full work. The precision and beauty of its action—the perfect ease with which it was managed, and the untiring force of its percussive blows—were the admiration of all who saw it; and from that moment the steam-hammer became a recognised power in modern mechanics. The variety or gradation of its blows was such, that it was found practicable to manipulate a hammer of ten tons as easily as if it had only been of ten ounces weight. It was under such complete control that while descending with its greatest momentum, it could be arrested at any point with even greater ease than any instrument used by hand. While capable of forging an Armstrong hundred-pounder, or the sheet anchor for a ship of the line, it could hammer a nail, or crack a nut without bruising the kernel. When it came into general use, the facilities which it afforded for executing all kinds of forging had the effect of greatly increasing the quantity of work done, at the same time that expense was saved. The cost of making anchors was reduced by at least 50 per cent., while the quality of the forging was improved. Before its invention the manufacture of a shaft of 15 or 20 cwt. required the concentrated exertions of a large establishment, and its successful execution was regarded as a great triumph of skill; whereas forgings of 20 or 30 tons weight are now things of almost every-day occurrence. Its advantages were so obvious, that its adoption soon became general, and in the course of a few years Nasmyth's steam-hammers were to be found in every well-appointed workshop both at home and abroad. Many modifications have been made in the tool, by Condie, Morrison, Naylor, Rigby, and others; but Nasmyth's was the father of them all, and still holds its ground."

Mr. Nasmyth, since he retired from business at the close of 1856, has occupied his leisure in the pursuit both of art and of science.

"That he possesses remarkable fertility of imagination, and great skill in architectural and landscape drawing, as well as in the much more difficult art of delineating the human figure, will be obvious to any one who has seen his works,—more particularly his 'City of St. Ann's,' 'The Fairies,' and 'Everybody for ever!' which last was exhibited in Pall Mall, among the recent collection of works of Art by amateurs and others, for relief of the Lancashire distress. He has also brought his common sense to bear on such unlikely subjects as the origin of the cuneiform character. The possession of a brick from Babylon set him a thinking. How had it been manufactured? Its under side was clearly marked by the sedges of the Euphrates upon which it had been laid to dry and bake in the sun. But how about those curious cuneiform characters? How had writing assumed so remarkable a form? His surmise was this;—that the brickmakers, in telling their tale of bricks, used the triangular corner of another brick; and, by pressing it down upon the soft clay, left behind it the triangular mark which the cuneiform character exhibits. Such marks repeated, and placed in different relations to each other, would readily represent any number. From the use of the corner of a brick in writing, the transition was easy to a pointed stick with a triangular end, by the use of which all the cuneiform characters can readily be produced upon the soft clay. This curious question formed the subject of an interesting paper read by Mr. Nasmyth before the British Association at Cheltenham."

But the most engrossing of Mr. Nasmyth's later pursuits has been the science of astronomy, in which, by bringing a fresh, original mind to the observation of celestial phenomena, he has succeeded in making one of the most remarkable discoveries of our time. Astronomy was one of his favourite pursuits at Patricroft, and on his retirement became his serious study.

The most remarkable result of his astronomical pursuits is the discovery, confirmed by others, and accredited by Sir John Herschell and other eminent astronomers, that the bright surface of the sun consists of separate, insulated, individual objects or things, all nearly or exactly of one certain definite size and shape, which is more like that of a willow leaf, as he describes them, than anything else.* These leaves or scales are not arranged in any order (as those on a butterfly's wing are), but lie crossing one another in all directions, like what are called spills in the game of spillikins; except at the borders of a spot, where they point for the most part inwards towards the middle of the spot, presenting much the sort of appearance that the small leaves of some water-plants or sea-weeds do at the edge of a deep hole of clear water. The exceedingly definite shape of these objects, their exact similarity to one another, and the way in which they lie across and athwart each other (except where they form a sort of bridge across a spot, in which case they seem to affect a common direction, that, namely, of the bridge itself),—all these characters seem quite repugnant to the notion of their being of a vaporous, a cloudy, or a fluid nature.

Long may James Nasmyth enjoy his active leisure.

* In connection with this very strange subject, it is rather a singular coincidence that those till recently much-despised philosophers, the alchemists, who speak of their red elixir, or golden (mineral) branch, as "Sol" call it also "the royal herb *or willow*." This may be a mere accidental coincidence, but it is at least curious, and worthy of a note in passing; as also is the still more strange discovery, by the Rev. Mr. Howlett, of a congeries of solar spots which he described as happening (probably accidentally) to assume the form of a tremendous skeleton, some thousands of miles in length.

THE NEW THEATRE ROYAL, GLASGOW.

The new theatre for Glasgow is now nearly completed, and will accommodate about 3,600 persons. The upper boxes and the lower and upper galleries of the old house are superseded by an amphitheatre. The stairs leading to the amphitheatre are 7 feet 6 inches in width. The theatre is in the form of an almost perfect circle, having a diameter of 42 feet, the radius from the centre to the box front being 21 feet. Around this circle the box, amphitheatre, and gallery audience are disposed, each seat directly fronting and commanding an easy view of the area available for stage business. An area of 3 feet 3 inches by 22 inches has been allotted each person in stalls and boxes, and all the seats will be divided by arms. The use of the "sunlight" has been determined on. Iron piping is to be introduced throughout every part of the house, to prevent, as far as possible, the possibility of accident by the escape of gas. No gaseliers will be used. The stage plan, and arrangements behind the scenes, have been directed by Mr. William Glover. The stage has been constructed by Mr. Drummond, the machinist of the theatre. The proscenium opening has been enlarged to 33 feet, and is flanked with pilasters, between which are placed the private boxes. A semi-circular arch spans the proscenium opening, the arch being supported on ornate brackets, and the panels enriched with ornamentation. The height from the stage to the crown of the arch is 45 feet. The level portion of the ceiling will be 42 feet in diameter, forming a circle of the exact circumference of the box frontage. The painting-room is 44 feet square by 30 feet high, and presents three sides of wall of great extent. The ornamental work for the box fronts, ceiling, and proscenium, is being made by Messrs. Jackson & Sons, London. The contractors are Mr. Robert Taylor, builder, West Nile-street; and Mr. John Taylor, joiner, George-street. The architects are Messrs. Potts & Son, of Sunderland.

SKETCHES AND STUDIES: SOCIETY OF PAINTERS IN WATER-COLOURS.

This second Winter Exhibition by the members of the "Old Society," comprising 384 sketches and studies, is even more interesting than the first, and the public have shown that they think so, the sales having been about double what they were at this time last year. Some of the artists, Mr. F. Tayler, Mr. Holland, and others, will not sell the sketches they exhibit, needing them for after-pictures. Perhaps two-thirds, however, of those sent were purchasable, and of these about ninety have been sold. A fresh source of income has been struck upon. It is to be hoped that it will not lead any into systematically "knocking off" a number of slight drawings for this special market instead of doing their best with perfected pictures. Some of the most finished bits sent are by Mr. Carl Haag and Mr. F. Smallfield, mostly admirable. Two or three of the members,—the veteran William Hunt, for example, who sends some exquisite bits,—make it the opportunity to show they are more versatile than their usual run of finished subjects would suggest. Mr. J. J. Jenkins is amongst the number: his capital landscape studies are an agreeable change from his pretty French fish-girls. Mr. Burton exhibits, besides a sketch for a large picture made some years ago, and other smaller works, his fine design for the "Fibula" given to Miss Helen Faucit at Dublin. Mr. John Gilbert, Mr. Birkett Foster, Mr. T. M. Richardson, Mr. E. Duncan, Mr. S. P. Jackson, Mr. A. P. Newton, and others, contribute strongly to the attractiveness of a collection that all should visit.

COMPETITIONS.

Halifax and Huddersfield Union Bank.—The design submitted by Messrs. Paull & Ayliffe, of Manchester, in a limited competition for this building, to be erected at Huddersfield, has been accepted by the directors. The new bank will stand upon a plot of ground in Westgate, near the Market-place, and will occupy a very commanding position in the heart of the town. The arrangements also include accommodation for the Huddersfield Chamber of Commerce. It is proposed to shortly commence the works, which will be carried out under the architects' superintendence. The proposed outlay is about 6,500*l.*

Wesleyan Chapel, Levenshulme.—The committee for the erection of this chapel, near Manchester, have selected the plans of Messrs. Paull & Ayliffe from a few designs sent in by local architects, and the building will be commenced forthwith under the architects' supervision. The style is the Decorated, and the cost will be about 3,000*l.*

THE ARCHITECTURAL MUSEUM.

PRIZES FOR WOOD CARVING.

The committee, in awarding the prizes, report as follows:—

"The committee of the Architectural Museum, after examining the *miserere*s tendered for the wood-carving prizes of this year, which were offered for a composition of not more than two figures, or of one figure and one animal, the subject being a profession, trade, or occupation, treated in modern costume, assign the first prize of 20*l.* to the one marked with a red seal (author Mr. John Seymour, of Tower lane, Taunton), the subject being a stonemason carving a vaulting rib of Ham-hill stone. This miserere appears to us commendable alike for the ease and anatomy of the figure, the accuracy with which modern costume has been reproduced in a graceful form, the truthfulness to fact of the tools, half worked block and stroke, and the flow with which the moulding of the seat ramifies into foliage. It is to be regretted that its author should have partially sand-papered the work, although he has obviously done so for effect and not to save work."

The Committee "assign the second prize of 5*l.* to the subject marked with a flower (author, Mr. J. M. Leach, of 1, Newmarket-road, Cambridge), representing a woman and child returning from gleaning, with sheaves on their heads. With much graceful treatment, and a comparative absence of sand-papering, this *miserere* is not equal to the stone-carver, either in anatomy or force. The figure of the woman and the child's bust are heavy, and the heavy flowing curls of the principal figure are untrue to actual peasant life."

"The committee allot an extra prize of 1*l.* 1s., or a book, at the choice of the competitor, to the carving marked 'Progress' (author, Mr. Alexander Kenmure, in the employ of Mr. Forsyth, of 8, Edward-street, Hampstead-road, London), representing a smith shoeing a horse. This clever composition fails in its practical applicability to the desired object. For instance, if it were really to be fixed as a *miserere* in any church the hammer and the bridle would soon be destroyed. Moreover, the *pose* of the horse is not consistent with fact, and the smith's expression falls in comparison with that of the mason in the first prize design. This work is not sand papered."

"The joint committee of the Architectural Museum and the Ecclesiological Society have chosen 'The Gleaners' as the subject of the colour prize of this year, considering that the dresses of the woman and child, besides the sheaves, afford a better field for colouration than the carver working a block of stone."

A. J. B. Beresford Hope, President.
Joseph Clarke, Hon. Secretary.

THE ARCHITECTURAL UNION.

The sixth annual meeting of this company was held on Wednesday, at the House in Conduit-street, Regent-street, Mr. Charles Mayhew in the chair. Mr. Moody, the secretary, read the report, which congratulated the shareholders on the success of the undertaking, that the rooms and galleries of the company had been fairly let during the past year, and that negociations were in progress with several societies connected with architecture to rent portions of the commodious and convenient establishment. The gross income for the past year had been 1,660*l.*, and the expenditure, 1,161*l.*, leaving a balance of 499*l.*, from which the directors proposed to pay a dividend of 8s. per share, free of income-tax, leaving 8*l.*

The chairman, in moving the adoption of the report, referred to the mortgage of 4,000*l.* existing on their premises, and said it was under the consideration of the directors to propose the issue of preference shares, with a guaranteed dividend of 4 or 4½ per cent., for the purpose of raising money to pay off the mortgagee. Mr. Jennings seconded the adoption of the report, which was agreed to.

Messrs. W. Tite, M.P., Mayhew, Jennings, Lamb, C. C. Nelson, and Wood, the retiring directors, were re-elected, and also Messrs. Lockyer & Cockerell as auditors. A vote of thanks to the chairman and secretary closed the proceedings.

THE LATE MR. F. T. BELLHOUSE, ARCHITECT.

Many of our readers in the north of England, will regret to hear of the death of this gentleman. Mr. Frank Taylor Bellhouse was the third son of Mr. David Bellhouse, now of Sale, near Manchester, but whose name and that of the grandfather of Mr. F. T. Bellhouse, have been identified with building in Manchester for a great number of years. Mr. Edward T. Bellhouse, the brother of the subject of this notice, is well known to most of our readers as a mechanical engineer, who has carried into effect important works at home and abroad, many of which have given occasion for the exercise of inventive ability, which in a marked degree he possesses. Mr. F. T. Bellhouse began his professional studies in Manchester about the year 1835, or 1836, in the office of the late Mr. Thomas Witlam Atkinson, best known since as the Siberian traveller, and having for his contemporaries in the office, the late Mr. J. W. Hance, secretary of the original Manchester Architectural Society; Mr. Cuffley; Mr. R. B. Critchlow, now of Southampton; the late Mr. J. E. Gregan; Mr. Edward Hall, F.S.A., and others. Subsequently, or after having had the advantage of a short sojourn in his father's office, he commenced practice as an architect. Some few years since, he was induced to settle in London, having entered into a partnership. For the last one or two years, however, when the partnership had terminated, he occupied himself chiefly in drawing, whilst turning attention to artistic pursuits connected with the profession. In these, as in his previous labours,—which in London, included preparation of many sets of competition drawings, as for the Manchester Assize Courts, the rebuilding of Bowden Church, and the Hartley Institution, Southampton, which received our attention,—he showed much ability, and industry that was of an extraordinary kind. He died at his residence in Royal Crescent, Notting-hill, on the 6th inst., leaving a widow, and the remembrance with many, of a valued and dear friend.

ST. MARY'S, DOVER.

This is one of the very old parish churches of the land. It was first a little primitive fabric, with its eastern wall, or chancel arch, where the font now stands, and resting its foundations in Roman work: about midway, in Norman style, the tower and nave up to the present pulpit line were added; the two easternmost arches still show the Early English chancel and north chantry, added about the time of King John. The long gap that followed presents the usual account, till it became the merely dangerous ruin taken down and rebuilt by the vicar in 1843: the foundations being then relaid, the ancient part being preserved stone by stone, and set on its old basis of Roman baths; the south aisle and chancel doubled in extent, and the capacity raised from about 700 to 1,750, 1,300 being free seats. The past twenty years, however, having victimized one-half of the fabric to dry rot, thus much of the woodwork had to be once more renewed. When laid bare, the whole basement presented a complete study of the disease, with its nature, growth, contagion, and results; enforcing the old neglected lesson, free access for air from outside. While all this was being restored again, some special works were carried on by particular friends. The chancel has been recovered to as near its original limits as might be; the floor raised, and paved with encaustic tiles, which, with a more elaborate pavement for the sacrarium, were from the works of Messrs. Maw & Co.; the absence of any too sacred symbols under foot, the Early English vine leaves and scrolls, and good geometrical patterns, with bright colour, being the noticeable features. The chancel has also its oak seats, to be filled by a rising choir. And, lastly, the gas service has been supplied with brass standards, and carrying each a corona of seventeen lights, from the works of Messrs. Hart & Son. The church was re-opened a few days ago by the Archbishop of Canterbury, the offertory leaving good hope that the remainder of the vicar's debt will not linger very long.

THE LATE GALES.

On Wednesday and Thursday in last week the country was visited, as Admiral Fitzroy predicted from the Admiralty, by gales of such intensity as fairly to merit the name of hurricane, in which the wind seemed to come from all points of the compass. An immense amount of damage has been everywhere done, both in town and country. Chimney-stalks have been thrown down by hundreds, roofs blown off, new buildings demolished, houses crushed by the fall of chimney-stalks, windows blown in, telegraph wires broken, and trees rooted up. Not a few persons have been killed, and great damage has been done to shipping. At Brompton a house in course of erection was blown done. At Newington a tall stack of chimneys fell upon a cottage, destroying it and its contents, and killing a child and seriously injuring three others. A curious series of coincidences happened to Mr. Lowe, a hatmaker in Fleet-street. As he was proceeding along the Blackfriars-road, a stack of chimneys fell near his feet, and he immediately ran away; but on crossing the street he turned to look at what damage

had been done, when the stack of chimneys of the next house to him gave way, but fortunately he was uninjured. A message was received on the same day by Mr. Lowe that a stack of chimneys belonging to his own house, in West-square, had fallen down, carrying a portion of the flooring with it. A large chimney fell upon the roof of the Liverpool Exchange, and did considerable damage to the building. At Birkenhead a chimney 40 feet high was blown down. At Manchester a new house, nearly finished, was blown down at Longsight, and a high chimney at Pendleton was destroyed. At Peterborough one of the pinnacles of the cathedral was blown down into the bishop's garden, and the gable-ends of several houses were driven in by the gale, and stacks of corn strewn over the country.

At Chester a number of the spires of St. Mary's Church steeple, recently re-erected, were thrown down upon the roof, and into the interior of the church; and in Grosvenor-road a new Roman Catholic Chapel, just about finished, suffered severely, a portion of the roofs and walls having fallen. At Sheffield, a lofty chimney in Jessop-street fell; and at St. Helen's a large piece of brickwork, about 9 feet long, was forced out of the chimney of the St. Helen's Patent Alkali Company, one of the largest chimneys in England.

The storm extended to France. At Nantes, a house in course of erection was blown down, and the owner killed. At Louviers, a high chimney in the manufactory of M. Brunel was thrown down, wounding several workmen. At St. Malo, one of the small spires of the cathedral was blown down. At Paris, the storm did considerable damage in many localities. At the Palace of the Permanent Universal Exhibition, in course of erection at Auteuil, a wall, 150 mètres in length, and strengthened by twelve stone pilasters, was blown down, and greatly injured the other parts of the building in its fall. In the Rue de l'Université, a large chimney was blown down, and fell in the street. Slates and tiles, as in London and elsewhere, were flying about in all parts of the city.

A sufficient idea of the force of the hurricane in London may be gathered from the fact that the anemometer on the Royal Exchange registered a pressure of 30 lb. on the square foot. When we consider that the anemometer is in the heart of London, this is most extraordinary, we believe it is said to be unprecedented; and were it not that the anemometer had just had a thorough overhauling at the hands of Messrs. Negretti & Zambra, one might feel inclined to doubt the correctness of the indications. During the gales of last October, at Greenwich the anemometer of the same construction registered 35 lb., whilst the one on the Exchange only showed a pressure of 18 lb.

LABOURERS' AND WORKMEN'S COTTAGES, PENGE.

A LIBERAL LADY.

TWELVE cottages have recently been erected at Penge, below the Crystal Palace, by a benevolent resident, Miss A. Dudin Brown, who, observing the wretched mode in which the large number of labourers in this part were housed, determined to offer some examples of a better kind of home. The buildings are on two sides of a central road, with garden courts in front, and yards in rear, four on each side being in a row forming one block, and a pair on each side forming another detached block. Eight have three bed-rooms, and four have two of larger size, and each has a good living-room, a scullery, a ventilated pantry, a coal and tool place, water-closet, cistern with water laid on. Miss Brown requires certain rules to be observed by the occupants, such as that the payment of rent be punctual; that there be no lodgers; that broken windows be mended by her and charged to the tenant in addition to the rent; that the gardens be kept in clean order, &c., &c. The outlay has been about 2,400*l.*, and the rents are calculated to pay about 3 per cent. This is only one of a series of good works carried out by Miss Brown in this hamlet; for she made a gift of the land upon which an infants' school and teacher's house were erected, and subscribed also to the building fund. Subsequently she erected a large girls' school and house entirely at her own cost of above 1,200*l.*; and, moreover, the church accommodation being insufficient, she built two new aisles to the church, at a cost of nearly 2,800*l.* All these works have been executed under the directions of an architect, Mr. Edwin Nash, of London. The contractors were, for the church, Mr. James Hollidge; and for the other works, Mr. John Warne.

RAILWAY MATTERS.

ALTHOUGH a great many of the schemes about to be laid before Parliament are small in extent of line, not a few are of considerable importance, and may be characterized as the extension of rootlet feeders to the great trunk and branch lines,—extensions very essential to the final profit and success of these lines. Doubtless there is an undue amount of speculation, however; and, although we cannot call it a revival of anything like railway mania, still much evil may be in store for speculators ere the whole affair is settled. In 1845 there were 620 railway schemes afloat, involving a (hypothetical) expenditure of 560 millions sterling; besides 643 other schemes which had not gone further than issuing prospectuses. More that 500 of the schemes went through all the stages necessary for being brought before Parliament; and 272 of these became Acts of Parliament in 1846—to the ruin of thousands who had afterwards to find the money to fulfil the engagements into which they had so rashly entered. In the present instance there is nothing to be compared with this state of matters; but considering the lesson then and at other times taught it is rather surprising that speculators should have gone to even the extent now indicated.

As regards the metropolitan and other town extensions, junctions, &c, there is one point which ought to be impressed on Parliament for behoof of the inhabitants. On lines already in existence, the Great Northern for example, and within the limits of the metropolis, night is made perfectly hideous, and the repose of thousands is destroyed, by the crowding out and in, during the whole night, of all the worn out, wheezy, asthmatic, groaning, noisy screamers of engines, surely, in the company's possession, for the transit to and fro of goods traffic; and if a like system be extended to new lines without any restriction of such nuisances by Act of Parliament, the result must be something diabolical and horrible to think of. It is all very well for railway companies, to allow them to work out their worn-out engines for their own selfish interests in this way; but the interests and the comfort and quiet of the public, especially through the night, ought to be consulted before the interests of such companies. Besides, although the promotion of goods traffic by night may be unavoidable, surely night is not the time when worn-out and incapable engines should be trusted to keep time on railways.

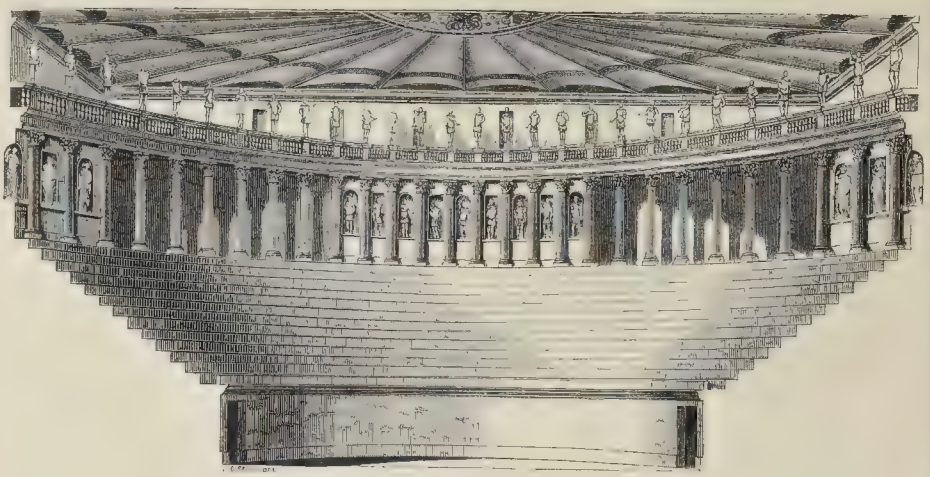
The Charing-cross line, as we learn from the newspapers, has been formally opened, but only provisionally, the line being still in an unfinished state. When all expenses are paid, this line will be found to have cost very nearly, if not quite, 1,000*l.* sterling per yard! Much of this immense expenditure was due to the opposition of the Governors of St. Thomas's Hospital. Though called by the general name of the Charing-cross line, the extension really embraces two distinct schemes, viz., the line from Charing-cross to London Bridge, and the line from Charing-cross to Cannon-street. Yet, though legally distinct, they are practically one; and from the junction at the Borough Market, where the Cannon-street branch diverges across the Thames, both run on the same viaducts to Charing-cross. The line leaves London Bridge station by a rather sharp curve of little more than 500 feet radius. Two girder bridges of immense span and horrible ugliness take it over the approach to London Bridge. A viaduct on iron columns carries it through the Borough Market, and thence the line is continued, with scarcely any curves or inclines worth speaking of, through the poor neighbourhoods lying between the Borough and Blackfriars, across the Blackfriars-road, and parallel with Stamford-street to the Waterloo-road, where it makes a junction with the South-Western station, which it enters by a single line of rails, and so practically brings that large system of lines to Charing-cross and hereafter to Cannon-street. From this it continues in almost a straight line across the York-road and the Belvedere-road to what was once Hungerford Suspension Bridge, but which has now been converted, if not into the handsomest, at least into one of the most important railway bridges over the Thames. On this the line is taken over the site of Hungerford Market, which has been transformed into one of the most lofty and spacious stations yet built in the metropolis. When the Charing-cross line is completed, there will be a perpetual running to and fro of trains, which the *Engineer* graphically compares to the motion of shuttles in a steam-loom, all day long.

The traffic receipts of railways in the United Kingdom amounted, for the week ending the 21st of November, on 11,028 miles, to 565,760*l.*; and for the corresponding week of last year, on 10,578 miles, to 520,237*l.*; showing an increase of 450 miles, and of 45,523*l.* in the receipts.

It was mentioned two or three months back that the county of Donegal had gained the distinction of making the cheapest railway in the United Kingdom; the Finn Valley line, of 13 miles, having been constructed for less than 5,400*l.* per mile. The following, from the *Dublin Daily Express*, shows that the results are such as might have been anticipated, and that a good dividend may be realised from an amount of traffic that, under an extravagant system of construction and heavy payments for land, would have been ruinous to the shareholders:—"The weekly receipts of the Finn Valley Railway have risen from 39*l.* in September to 82*l.* last week. The inhabitants of the county of Donegal are at last beginning to taste the advantages of railway communication. Should this railway, as is usual, double the ordinary road traffic, the receipts would be about 200*l.* weekly, which would pay the shareholders above 10 per cent. When we are enabled to announce this, we shall look to see few districts in Ireland without a railway."

A railway has been seized by the sheriff. Mr. Death, sheriff's officer of Petworth, on the 23rd ult., took forcible possession of the Mid-Sussex and Midhurst Junction Railway, under an order from Chancery, at the suit of the Bishop of Oxford, for contempt of court, the railway company not having answered a bill filed by his lordship against them. A large staff of officials were forthwith placed over the whole railway, and all the men employed, amounting to upwards of 250, were stopped. On the 30th inst., we are informed, it can be sold if the matter is not settled.

DWELLINGS FOR THE WORKING CLASSES IN THE CITY OF LONDON.



SOME efforts are being made at the present time, for the purpose of providing dwellings for the working classes in the neighbourhood of such localities as are affected by pulling down the tenements and other buildings in courts and alleys, and rebuilding on their site extensive manufactories and offices, adapted for the increased requirements of the metropolis. The united parishes of Saint Lawrence Jewry and Saint Mary Magdalen, Milk-street, with this object in view, and being the freeholders of a small piece of ground in Huggin-court, in the neighbourhood of Thames-street, upon which stood lately several ruinous and ill-contrived tenements, have pulled these down, and erected in their stead a building for the residence of the working classes, in which lighting and ventilation are better attended to.

The avenue has been widened, and the ground-floor contains two shops, with the entrance in the centre of the building, communicating with the apartments on the upper stories and the roof, upon which is placed a ventilating lantern. The apartments consist of three sets of sitting-rooms, with bedroom adjoining, on each side of the public stairs, forming accommodation either for three or six families, according to the number of rooms required; and the basement story is fitted up for laundry purposes. We are forced to express regret that only one bedroom goes with a sitting-room.

The parishes have invited the attention of such public companies as have taken an interest in providing accommodation for the working classes; and the Chief Commissioner of City Police has inspected the premises, with the view of adapting them for the families of the force who are obliged to reside in the City. Messrs. John Young & Son, of King-street, Cheapside, were the architects.

THE NEW STABLES AT MARLBOROUGH HOUSE.

THE building has the form of a block with two wings, and is constructed principally of bricks. In the centre of the block is the Royal entrance, leading into the garden skirting the Mall of St. James's Park, and communicating with the whole of the stables, coach-houses, harness-rooms, and offices of the structure. On either side of the Royal entrance are two coach-houses, each divided into three divisions, and each division capable of holding two carriages. The quadrangle in front of these coach-houses, together with the Royal entrance, is covered by an enormous skylight, supported by light iron columns, and open upon its three sides for the operations of inspecting and washing carriages, &c.; while the quadrangle

PALLADIO'S THEATRE, VICENZA. THE AUDITORIUM.

itself is lighted with gas, provided with clocks, manure-pits, water-tanks, and trapped drains. The stables include forty-five stalls and twelve loose boxes. All the fittings have been supplied by Mr. Barton, of Oxford-street, and are of iron, of a chocolate colour, excepting where the vitrified enamelled linings of the cornbin do duty for paint. The hay-racks are flat at the bottom, with open trellice-work, by which all dust is permitted to fall through. They are filled from time to time by hand, and all upper supply of fodder from lofts is entirely avoided. No projections or flanges are detectable anywhere, and the hayrack is provided with an "improved slip-back," to prevent the possibility of the horses' noses or heads getting fixed between the apertures. In the front of the corn-bin, hayrack, and water-tank, a "friction guard roller" is placed. The stalls are divided by boarding, surmounted by open ventilating "Exhibition pattern" iron railings, and are terminated by pillars, with stall rings and chains, which gather up and festoon. The handles of the loose boxes are all flush with the doors, and while at the command of the groom, are beyond the operations of the horse. The floors are paved with brick laid edgeways. Ventilation is supplied by open-work just beneath lofty ceilings. It being the general belief, that ophthalmia in horses has been aggravated, if not altogether induced, by the glare and refraction of white tiles and other glazed surfaces, the whole of the skirting opposed to the horses' vision is lined with Ravi-encioni marble of a bluish-grey colour, from the works of Messrs. Burke & Co., of Warwick House, Regent-street. In some of the stables are long rows of slate reservoirs for water, which, by closing, are converted into seats for the men. The builders were Messrs. Smith & Taylor, the successors of Messrs. Kelk; and Mr. Pennethorne was the architect.

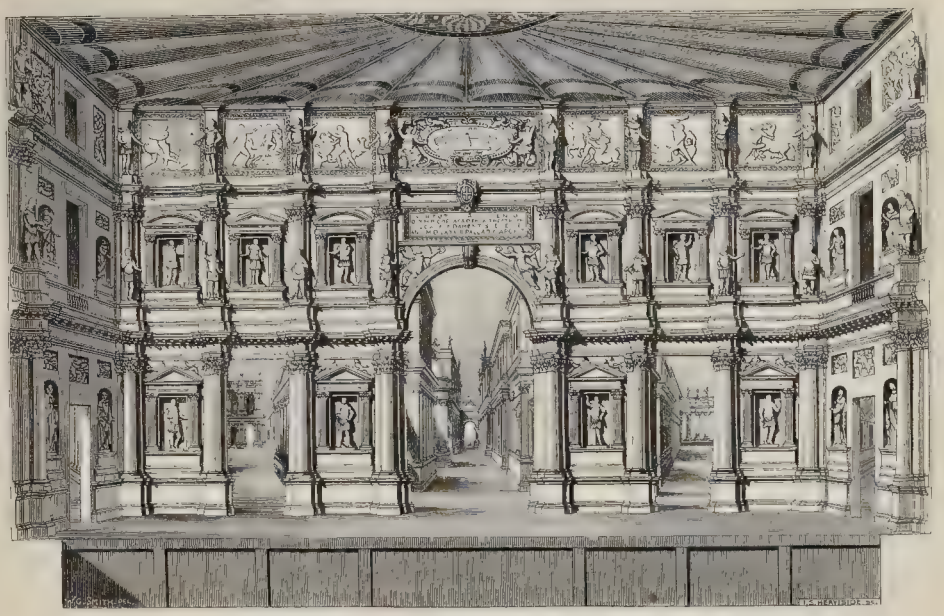
SCHOOLS OF ART.

The Warrington School.—The annual examination by Mr. R. G. Wylde, H.M.'s Inspector of Schools of Art, of the works executed in this school, took place on the 24th ult., with gratifying results. No less than twenty-seven medals were awarded, and sixteen of the works were selected for National competition. One of the students (W. Jenkins) aged only fourteen years, the son of a gardener, has obtained five medals, one for each work executed, and two of them have been selected for National competition. The successful result of this examination must be gratifying both to the council of management and the master of the school, Mr. J. C. Thompson. The works were subsequently opened for public exhibition during the remaining four days of the week, when nearly 5,000 persons availed themselves of the opportunity.

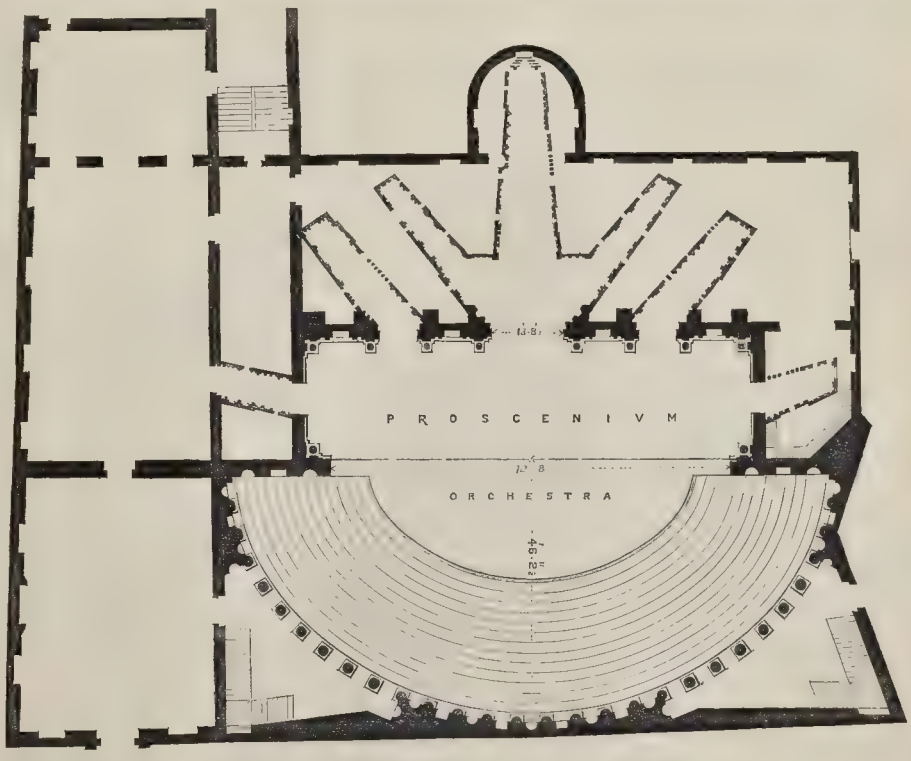
The Gloucester School.—For four or five years this school has been unobtrusively at work, and no appeal has ever been made to the public for pecuniary help. Supported by a small but practical committee, and a liberal president (Mr. T. Gambier Parry), the art-master, Mr. Kemp, has laboured on, and the school is now self-supporting; still there remains a small debt incurred in the necessary adaptation of the premises in Longsmith-street to the purposes of the institution, and other unavoidable expenses connected with the founding of the institution; and in order to extinguish this, but still more to widen the interest felt in the school and to increase the number of pupils, it was determined to hold a public distribution of the Government prizes at the Corn Exchange, with an exhibition of drawings, &c.; Mr. Parry also reading a paper "On the Claims of Art upon an Age of Business."

MONUMENTAL.

The working-men of Leeds have determined to erect a statue to the late Sir P. Fairbairn as a public acknowledgment of the great services rendered by him to the borough.——A number of additions to the relics in the Burns Monument, Calton Hill, Edinburgh, has lately been made, and the museum promises shortly to become one of the most attractive exhibitions in Edinburgh. On the last visit of Mr. David Roberts, R.A., to his native city, he commissioned Mr. Ballantine to have the floor covered with kamptulicon of a design in harmony with the building, which has been done, and the expense, amounting to upwards of 10*l.*, defrayed by Mr. Roberts. Colonel William Burns, son of the poet, has forwarded the original model of the marble statue by Flaxman. The marble statue was completed after the death of the sculptor, and much of the character in the original model, according to the *Scotsman*, has been lost in the marble. An interesting document, presented by the poet's sons, is Burns's diploma as a member of the Royal Company of Archers, the Royal Body Guard for Scotland.——A monument to the Rev. Patrick Brewster has been erected in the cemetery at Paisley. The site chosen is at the upper end of the walk leading from the public entrance, where several roads branch off. The monument, which was erected by Mr. John Mossman of Glasgow, the sculptor of the bronze statues of Sir Robert Peel and Provost James Lumsden, in Glasgow, is made entirely of sandstone. The portions forming the pedestal are from the quarry which supplies the National Wallace Monument, and selected for its durability. The figure is of the celebrated Binny stone. Mr. Brewster is represented standing, as if about to address a public meeting. The pedestal in structure is Gothic. The designs of the mouldings at the base are all taken from the pillars of the Abbey Church. The height of the figure exceeds 7 feet, and, with the 9 feet of pedestal, makes in all nearly 17 feet.——The statue of William Dargan, according to *Saunders's Newsletter*, has been placed upon its pedestal on the lawn of the Royal Dublin Society, in front of the National Gallery of Ireland, at the west side of Merrion-square. ——A monument is now being erected at Ajaccio, intended to commemorate, at the same time, the Buonaparte family, and the glory of the First Empire. The group is composed of five bronze statues, each 6 feet high, and representing Napoleon I. and his four brothers. The emperor is on horseback, in Roman costume, and behind him stand the others. The whole group will be placed on a pedestal of white marble, in the rear of which a triumphal arch with three openings is to be erected.



A GOOD EXAMPLE.



We are glad to find that a class for the instruction of artisans in geometrical, mechanical, and freehand drawing, has been established in connexion with the extensive works now in progress at Pilmore Hall, Croft, the seat of Mr. A. Backhouse, for which Mr. Waterhouse is the architect. Mr. Backhouse has in a liberal manner provided the workmen with drawing-boards, squares, &c. The class is under the direction of Mr. Hoskins, the clerk of the works.

CHICHESTER AND ITS CATHEDRAL.

The Rev. C. A. Swainson, canon residentiary, recently gave a lecture, at the Literary and Mechanics' Institute, on "Chichester and its Cathedral." The reverend lecturer commenced with some remarks on the condition of the country before the Roman times, when it appeared our predecessors in Sussex lived in wigwams very similar to those which are occupied by the Bechuanas now. He then spoke of the invasion of Claudius, drawing special attention to the fact that Chichester, as it now is, must have been planned and built whilst St. Paul was holding intercourse with Aquilla and Priscilla at Corinth. He then gave a sketch of Archdeacon Williams's proof that Claudia and Pudens, mentioned in 2 Timothy iv. 21, were "Chichester people,"—a statement which, he said, was possible and even not improbable; and so passing by the inroad of Ella and Cissa, and the advent of Wilfrid, the lecturer came to the removal of the Bishop's See from Selsey, "the Island of the Sea Calf" or Seal, as old Bede called it, to the city of Chichester. That Chichester was a city with its own mint, as early as A.D. 1000. He described the gradual rise of the cathedral, notwithstanding the serious injuries and disappointments caused by the great fires of 1115 and 1185, until, under successive bishops, it was beautified and weakened by the erection of a spire,

THE OLYMPIAN THEATRE, VICENZA. THE SCENE.—ANDREA PALLADIO, ARCHITECT, 1580.*

Plan.

[* See page 873, *ante*.

and the insertion of the great north and south windows. On these steps in its construction I need not tarry, because they are well known from the interesting memoir of Professor Willis, from which the lecturer said his information was taken. He passed on to later facts which, he observed, he had culled from the documents in the muniment-room. One of these was a curious memorandum of a visit paid about 1684 to the cathedral by Sir Christopher Wren. The great architect of St. Paul's is well known to have been no friend of the early ecclesiastical architecture of the country, and in this instance it was certainly well that his advice was not followed. It seems that the great north tower at the west end of the cathedral had "fallen down about fifty years earlier" (a fact which was hitherto unknown: it was believed that it was battered down at the siege of 1642), and the southern tower was very insecure. It was deemed hopeless to raise money to restore the fallen tower, and therefore Wren advised the chapter to pull down the other also, to shorten the cathedral by one bay, and then "to close all with a well-designed and fair-built west end and porch, which would make the west end of the church look much more handsome than ever it did, and would be done at half the charge." The lecturer said he had discovered that there was a large sale of timber on the chapter estates in 1797, for the repairs of the cathedral, "the great arch on the northern side of the quire being in a very dangerous condition;" that in 1736 the spire was partly taken down, for the communar was ordered to go on with its restoration until it was finished to the top; and that in 1813 contracts were again entered into to take down 11 feet of the spire and rebuild it. From the cathedral the lecturer passed to the clergy connected with it: the secular canons, who were transferred from Selsey, and who have lived in their canonical houses, in Canon-lane, from 1075 to the present year. He quoted the statutes of 1247 to show what the nature of these residences was, and the respective duties of dean, cantor, treasurer, and so on, according to the original constitution of the Church. They were called "canons," because they were bound to take their duties in the cathedral according to the "canon," or law, of the Church; and seculars because they lived almost in the world in their own houses, instead of under the roof of a monastery. Residentiaries, he observed, certainly were in existence in 1247, and he raised a smile by describing the forms that had to be gone through before a canon became completely a residentiary. He was bound for a year to attend every service at the cathedral, and if he ever failed he had to begin over again, and each day he was to dine at his own table the vicar of his stall, two other vicars of the church, the porter, two sacrists, and one chorister-boy: of course, this could not be maintained long, it was too expensive and irksome; and so he traced the clergy until he came to 1574, when the constitution of the cathedral as it is at present was fixed. But the greatest insight into the customs of antiquity was given by the statutes of the vicars choral, which were "codified" a few years before the Reformation. They received the old gilden hall of the city, the present girls' school, in the year 1394; here for more than a hundred years they met for dinner, &c. Here still remains the pulpit where the reader stood during part of the meal, reading the Bible, or some other holy book;—here the raised platform or dais, on which the high table was placed;—here the lavatory which was needed for their fingers, seeing they had no forks to carry their food to their mouths. The vicars ought all to be in their square before the curfew rang. When they went out of the close they were not to carry a sword, unless they were going into the country,—a curious illustration of those unsettled times. They were to keep no dogs within the precincts: they were to ask no one to dinner in their hall without giving notice to the cook; and all these rules were solemnly enacted, and the seals of the bishop, the dean and chapter, and the vicars themselves, were appended to the document. The reverend lecturer gave several other interesting anecdotes in relation to the cathedral manners and customs of olden times, and appeared thoroughly to interest and amuse a very large audience, among whom were the Lord Bishop of the diocese, the very rev. the Dean, and many of the clergy of the city and neighbourhood. F. W.

P.S. The restoration of the cathedral is going on remarkably well. The tower is now brought to a height of 85 feet above the level of the nave, so that it may fairly be anticipated that, ere long, we shall see a counterpart of the late beautiful spire,—a faithful portrait of a departed friend.

THE FALL OF HOUSE IN ISLINGTON.

The inquiry into the circumstances attending the death of the two men caused by the fall of the Wheatsheaf public-house, mentioned in our last, was continued before the coroner on Monday last, at the Ship, Camden-street, and six of the workmen were examined. Their evidence showed that the centre piers on the ground-floor, 14 inches square, carrying arches, and bressummers behind the arches, buckled and failed. *Two courses of brickwork had been left out in the piers for the purpose of allowing the doorsteps to be put in.* The arches were 4 inches thick in cement: there were four courses of 4-inch work in front of the bressummers, of course without bond. It had been observed about a week before the accident that the arches had bulged slightly. The centres had been struck. If we are correct in these points (the principal witness, Meldrum, prevaricated very much), the cause of the unfortunate occurrence is quite clear. The inquiry was adjourned until Monday next.

At the meeting of the Metropolitan Board of Works, on the 4th inst.;—

Mr. Valliamy, superintending architect, made the following report respecting the fall:—

"From a careful examination of the facts I am decidedly of opinion that over haste was employed, not only in building the walls, but also in following up the other works, which would necessarily cause a great jar upon the unset and green brickwork. The ends of the floor joists rested upon the front wall, and a great many men were at work on all parts of the building. I am unable to say with certainty what was the immediate cause of the fall, but I think it very probable that one or more of the piers under the bressummer either sank or buckled."

A letter received from Mr. Moseley, the district surveyor, contained the following statement:—

"The whole of the work was executed, so far as completed, to the best of my belief in full accordance with all the rules and provisions of the Building Act. I attribute the failure to the want of the due and sufficient setting of the mortar and cement, arising from the state of the atmosphere, the rapidity of the execution, the vibration of the scaffolding, or perhaps the whole combined."

Both documents were referred to the Building Act committee.

CHURCH-BUILDING NEWS.

Rye.—The restoration of the window at the east end of St. Clare's chancel of Rye Church, has been executed by Mr. Smith. A similar restoration is in progress of the window of the south-east chancel (now used as the National and Church Sunday School rooms), the space having for many years been filled up with plaster. To effect this renovation about 60*l.* are required, of which sum 35*l.* have already been subscribed.

Christchurch.—The Rev. Zachary Nash, according to the *Athenæum*, collected 3,000*l.*, and applied it to the restoration of the church of Christchurch. Still, little more has been accomplished than the arrest of the decay. Where restorations could be effected, these have been carried out by Mr. Ferrey. The great work, however, of restoring to something of its old splendour one of the most magnificent of churches, singularly poor in local resources, is one to be effected by the public at large.

Woolston.—St. Mark's Church, which has just been erected at Woolston, by Mr. Bull, of Southampton, builder, after designs by Mr. White, of London, has been consecrated by the Bishop of Winchester. It consists of a nave, with north aisle and transept, and chancel, the arches on the south side being temporarily bricked in, and at present forming an arcade, in order to add a south aisle as soon as the funds will permit of this being done. The clerestory is lighted by three or four windows on each side, containing four lights, divided by mullions, with pierced headings. The roof is open, and the woodwork is intended to be stained when funds are in hand. The stone employed for the main body of the building is Swanage, the dressings being of Corsham Down. The inner walls and arches are faced with bricks of various tints, arranged in regular order, with a variety of patterns and bands, the pillars and capitals being of Bath and Tisbury stone. The capitals are not carved, but are left in such a state as to allow of this being done at some future period. In the chancel, the arches which separate it from the narrow chancel aisle are supported by single shafts of polished Devonshire marble. The entrance to the church is on the northern side at the western end, by a doorway beside the base of the unfinished tower. There is a temporary turret for the bell already hung. The sittings are in varnished open deal benches, and number about 300, some of which are free.

St. Helen's.—The church of St. Helen's has been re-opened by the Bishop of Worcester, after the insertion of a new east window and other works of restoration. The new window, which is of the Geometrical Decorated style, and consists of five lights with trefoil heads, and tracery above, has at present stained glass only in the tracery, though it is in contemplation also to fill up the five lights as soon as sufficient funds can be raised. The design and execution of the window were by Mr. Preedy, London, architect, as we have before stated. The work is a memorial to the late rector, the Rev. J. H. Wilding. In the centre at the head of the tracery is a circle, having twelve foliations or cuspings, and the subject of the design is the Ascension. On either side, lower down, are two smaller circles, with eight cuspings, each circle containing an angel, one with a harp and the other an organ. The architect named has also sent a design for a reredos, which has been approved of by the bishop, and will shortly be erected. The Nash monument on the north side of the communion table has been cleaned, painted, and restored, at the cost of Dr. Nash, by Mr. Stephens, sculptor.

Bath.—A vestry meeting has been held in the Abbey Church for the purpose of considering the specifications received from Mr. Scott of sundry necessary repairs to be done to the outside of the church. It was stated that Mr. Scott's estimate for the whole of the internal arrangements was 12,000*l.* If a stone roof were put up in the nave, to correspond with that in the choir, it was calculated that it would amount to 3,000*l.* out of the 12,000*l.*, and that the repair of the windows would cost about 2,300*l.*; but the present specifications did not take in the whole of the windows. A large portion of those not referred to were in a bad state, and to them something must be done. An estimate had also been made by Mr. Hill for re-erecting and improving the organ "so as to make it one of the finest ecclesiastical organs in the kingdom," for 1,200*l.* It was arranged that a committee should be formed as soon as the tenders for the work were received from the architect.

Rigsby (*Alford*).—The church at Rigsby, which was one of the oldest in this country, dating from before the Norman Conquest, being in a most dilapidated and dangerous state, was taken down in the early part of the present year. Sufficient funds were nearly collected to build a new church. This has been done under the directions of Mr. Fowler, of Louth, architect. The new church is built in the Norman style, of Ancaster stone, the outside being faced with white brick, ornamented by red brick. It has a circular window in the west front, filled with stained glass, the gift of Lady Mary Nisbet Hamilton: the three lancet windows in the apse are also filled with stained-glass memorial windows, the gift of Mr. Higgins. Another memorial window, the gift of Dr. West, is being prepared. The church will hold about 120 persons. The benches are of stained deal, and the pulpit is of Caen stone.

Fovant.—The parish church of Fovant has undergone complete renovation, principally by the assistance of the trustees of the Pembroke Estate, and is now re-opened. The church has been restored as nearly as possible according to the original design. As much of the old walls as possible has been preserved, but the roofs of the nave and chancel, which are waggon-headed in form, are new. During the progress of the restoration, considerable portions of Norman work were discovered, showing that a highly-decorated church in this Early style once occupied the site of the present edifice. Among these remains a Norman doorway was found in the south wall, so near to its present position that Mr. Wyatt, the architect, felt justified in using it as the entrance to the chancel aisle. The east window, which is of three lights, is in the Decorated style, and is filled with stained glass, by O'Connor, the design being copied from a picture by Guido, representing the Crucifixion in the centre compartment, with the Virgin Mary and St. John on either side, with angels above in the tracery. At the base of the window is a brass containing the following inscription:—"To the glory of God, and in memory of Sydney Lord Herbert, this window is erected by his widow." In a single-light window on the north side of the chancel is a figure of St. George, the patron of the church; and a little further westward, on the same side, is a two-light window, representing in one compartment the Saviour knocking at the door; with the words, "Behold, I stand at the door and knock;" and in the other compartment as the Good Shepherd, with a lamb in his arms. These two windows are also the gift of Lady Herbert, and are the work of Messrs.

Lavers & Barraud. The west window, which is of Perpendicular character, is of four lights. It is filled with stained glass representing the four Evangelists, in life size; and is the gift of the parishioners, "in memory of their friend and neighbour, Lord Herbert." The carving of the pulpit and of the rest of the work in the church is by Mr. S. Sansom, of London. The seats of the church are open, and are of stained deal, and varnished, all the doors of the edifice being of oak.

St. David's (Pembrokeshire).—In consequence of the dangerous condition of St. David's cathedral, as already noticed, it has been inspected by Mr. Scott, who has prepared a report in which he estimates the cost of its restoration at 30,000*l.* This report has just been laid before the public meeting of inhabitants of Carmarthenshire, announced to be held at Carmarthen. The bishop of the diocese presided. Lord Dynevor moved the first resolution:—"That the state of the Cathedral of St. David's, as described in Mr. Scott's report, renders it desirable that steps should be immediately taken with a view to its repair and restoration." His lordship pointed out that a portion of the tower of the cathedral, which was 700 years old, was crushed, and was only supported or "bolstered up" by the wall which abutted against it; two of the four supports of the tower being wholly untrustworthy. He thought that they might confine their yearly expenditure to 3,000*l.* or 4,000*l.*, and so extend the subscriptions over a number of years, the subscribers paying them by instalments. This resolution having been seconded by Mr. Pugh, M.P., Mr. Scourfield moved:—"That the portion of the work to be undertaken in the first instance include the repairs of the tower, and parts immediately in connexion with it, and the restoration of the choir or eastern arm of the cathedral." This resolution having been carried, Colonel Sir J. J. Hamilton suggested the erection of a new cathedral in a more central position in the diocese. He would contribute 1000*l.* towards the restoration of the cathedral as a parish church, and for the erection of a new cathedral in Carmarthen he was prepared to do a great deal more. Mr. Scott then addressed the meeting, explaining the state of the cathedral, which, he said, was at present not only in a dangerous, but a disgraceful condition. The tower was imminently dangerous. A committee was then appointed, including the bishop, the dean and chapter, and the archdeacon of the diocese, the members for the counties and boroughs, Earl Cawdor, Lord Dynevor, Mr. Beresford Hope, M.P., and other gentlemen. Some large subscriptions were announced, including 1,000*l.* each from the bishop and the dean and chapter, 500*l.* from Lord Dynevor, 300*l.* from the Rev. Sir Erasmus Williams, in addition to 200*l.* included in the dean and chapter's donation.

Liverpool.—The church erected at Tunnel-road, Edge-hill, and dedicated to St. Catherine, has been consecrated by the Bishop of Chester. The building is in the Early English style of architecture, built of brick, with Stourton stone facings, and erected on land belonging to the trustees of the late Mr. Thomas Earle. The late Lieut.-Colonel Adam S. Gladstone contributed 1,000*l.*, and the late Mr. William Gregson subscribed 600*l.* The building will accommodate 890, the seats in the gallery being free. Mr. J. D. Gee was the architect; and Messrs. Nicholson & Ayr were the contractors. The building was erected at a cost of 3,000*l.*

STAINED GLASS.

St. Mary's, Hulme.—Two more lights of the great east window of this church have been filled with stained glass, by Hardman, of Birmingham. These subjects are "The Baptism of our Lord," "Angels Ministering to Him after the Temptation," "The Marriage at Cana," "The Agony at Gethsemane," "Christ bearing the Cross," and "The Crucifixion." These form part of a series of eighteen subjects, all taken from the life of our Lord, which will fill the six lights of the window; the tracery being filled with the "evangelistic symbols," angels, emblems, and other devices. Four of the lights are now filled. The size of the window is 48 feet and 25 feet. The cost of the whole will not be less than 1,000*l.*, which has been undertaken by one member of the congregation.

Sedgefield Church.—A large number of the clergy of the diocese, including the bishop, have given one of the windows filled with stained glass in the north aisle of this church, as a memorial of affectionate respect and esteem for the Rev. T. L. Strong, the rector. The subjects chosen for illustration are "The Administration of Baptism" and "The Lord's Supper;" the lower part of the lights in the window beneath the chief subjects being filled in with "The Baptism of Cornelius" and "The Institution of the Passover." Messrs. Lavers & Barraud, of London, executed the work, under the direction of the Revs. Messrs. Park & Ford.

Sowerby Church, near Thirsk.—This church has been lately embellished by the insertion of three stained-glass memorial windows. One, consisting of two lights, is placed on the north side of the nave, opposite the south door of entrance, and forms a couplet. Each light contains a Scripture subject; that on the left representing "The Annunciation of the Virgin Mary;" the other, on the right, "The Saviour appearing to Mary Magdalene in the Garden, after his Resurrection." Above these, as well as below, occurs scroll work. Ornamental borders run round and enclose the whole. Another memorial window, of one light, is placed in the angle of the south transept, where it joins upon the nave, and is altogether of a different cast. It is geometrical in character, and surrounded by a border. The subject represented upon it is "The Woman touching the Hem of the Saviour's Garment;" above and below which is a medallion, enclosing a cross *pattée*. These windows have been erected by Mrs. George Holmes, in memory of relatives. The third memorial window, also of one light, is placed at the angle of the north transept, and is similar in character and design to the corresponding window in the south transept. The subject represented is "The Saviour as the good Shepherd;" having likewise, above and below, and enclosing, a cross *pattée*. This window was erected by subscription, as a tribute of respect to the memory of a churchwarden of the parish of Sowerby. The windows are of the Norman style of architecture; and the artists were Messrs. Warrington & Sons, of London, who also executed the triplet recently erected at the end of the north transept of this church, to the memory of several members of the Cayley family.

Old Church, Ayr.—Another memorial window has just been erected in this church, to the memory of the late Mr. John Boswell, of Garallan, by his fellow townsmen. The subjects in the twin lancet-lights of the window are, "Our Saviour weeping at the Tomb of Lazarus," and "Our Saviour raising Lazarus from the Dead." The work was done by Messrs. James Ballantine & Son, of Edinburgh. The colouring and ornamentation are in harmony with the other windows recently erected in the church by the same artists.

British Church, Riga.—By an accidental transposition of the printer, the large east window of this church, which was executed by Messrs. James Ballantine & Son, of Edinburgh, is made to appear as if it had been the work of other artists previously named.

THE METROPOLITAN SEWAGE QUESTION.

THE Metropolitan Board of Works have resolved,—

"That, inasmuch as the Board are bound by various provisions of the several enactments under which their works are carried on so to conduct them as not to cause a nuisance, and that the profitable employment of sewage under the schemes proposed in the tender may involve its application to the surface of the land on an extensive scale, they cannot be parties to any agreement for such application unless they have clear information on the localities, nature, and extent of the land to be so dealt with, and satisfactory assurance that the processes to be employed are such as not to cause a nuisance; that none of the tenders received being sufficiently clear upon this point, the Board therefore refer them generally to the Main Drainage Committee, in order to obtain essential and detailed information, and to confer with the several promoters as to other conditions of the advertisements upon which their proposals are neither full nor explicit, and generally to consider as to the utilisation of the sewage."

The vestry of St. James's, Westminster, at a special meeting, also to consider the tenders, resolved to urge their representative at the Board to oppose the granting of any concession until further opportunity for inquiring into the plan of Mr. Ellis has been afforded.

Meantime this gentleman is still busy propagating his ideas through the press, and has issued through Ward, of Bartholomew Close, publisher, a new pamphlet on the subject, titled "The Sewage of the Metropolis, and how to utilise it."

Mr. James Edmeston, architect, has also published a pamphlet, titled "How can the Town Sewage be best preserved and utilised," in which he urges an adaptation of the Paris system to London; but with the best will to consider any proposition of Mr. Edmeston's, we cannot listen for a moment to the adoption of any modification of the night-stool system here: its unwholesome and offensive results in Paris afford precisely one of the strongest arguments against it in our opinion.

THE PROPOSED SCHEME FOR RAISING HOLBORN VALLEY.*

SIR,—The Corporation plan for raising Holborn valley is now before the public. Its chief merit,—if a merit it be,—consists in separating the two great lines of traffic from each other, the Holborn line being raised 25 feet.

Now, Sir, permit me to ask what would the public say to any scheme that proposed raising the New-road where it passes Tottenham and the Hampstead roads 25 feet, or to the raising Oxford-street at the Circus, the same height above Regent-street, obliging all traffickers to find their way round, up easy ascents, to the higher level? I would not be the person to propose such a scheme. The plan places a viaduct bridge over the valley at the Holborn end, allowing 21 feet headway: it raises the valley beneath 6 feet. Not one of its hills is made level. Farringdon Market is shut out completely from Holborn; but considerable attention has been given to the formation of approaches to the new Meat and Poultry Market. Now, in the words of an old song,

> "It is well to be honest and true,
> And it is well to be off with an old love
> Before you are on with the new."

Farringdon Market is placed upon a steep hill: two of its three sides are closed, from the difficulty of access. Its return of profit last year to the Corporation was 40*l.*

> Now is it either honest or true
> To knock an old market down
> As soon as you think of a new?

To carry out the Corporation scheme, no less a number than 646 houses are required to be removed. If these are all to be purchased and paid for at the same rate as those obtained by the London, Chatham, and Dover Railway Company, in their passage through the City, over five million sterling will be required, and this before a pound is laid out in reconstructing the roads. The plan is as objectionable as any that has been made for the purpose during the last forty years. It is on the old and fallacious principle that the valley should be attacked at one of its cross sections, instead of at its main centre line, and success, therefore, is impossible.

By raising the valley from north to south, all the hills are levelled, the market is rendered easy of access, and the Holborn end made another Regent's-circus. It can be done without removing a single householder, and at an expense of less than half a million: side streets to both old and new markets can easily be formed; and the plan, moreover, would return interest for the money expended.

C. J. RICHARDSON.

* We print the following from one who has given some attention to the subject, with the view of aiding in the ventilation of a question of enormous magnitude, and not with any desire to throw obstacles in the way of the Corporation's proceedings.

CONSTRUCTION OF TEMPORARY BRIDGES.

IN a recent impression of the *Builder* you gave an account of a suspension-bridge lately put up by the Royal Engineers at Chatham: allow me to give you a description of one erected by the Volunteer Engineers whom I have the honour to command. The bridge was put up in the month of June, on the occasion of a field-day at Torquay. The spot selected was a chasm between the mainland and a detached headland or rock, distant 65 feet. Sergeant-Major (R.E.) John Jones's iron gabion bands were used as the supports; but as the materials supplied by the Government were limited, viz., only 200 bands, without any superstructure, the *gabion pickets*, interwoven with the bands, as used in the construction of gabions, were adopted to form the platform of the bridge; and, for infantry purposes on a small scale, will be found very efficacious, and possessing this advantage, that nothing but the gabion-bands need be taken to encumber the troops. A sufficient number of gabion bands to construct a bridge of 50 feet span may be stowed in a space of *four cubic feet*.

The bridge consisted of ten lines of gabion bands alternately double and single: each band was united to the adjoining one with the slot and button on the bands themselves, but for additional security I had the double bands fastened with the

small nuts and screws used for fastening eaves gutters. The end bands formed loops, which were passed over straining pieces, and with blocks and tackle were strained and secured to two posts at each end, firmly driven into the ground in a raking position. This bridge was twice erected by about twenty volunteer engineers in two hours, and was used by them and the public for approach to the rock for several weeks with as many as twelve persons at a time upon it without the least sign of weakness being apparent. The bridge was constructed exactly similar to a *gabion*, being 2 feet 9 inches wide, and a continuous piece of *basket* work. With the exception of the gabion bands and straining tackle, the materials for a bridge of this description may be generally obtained in the field.

Edward Appleton, F.I.B.A.
Officer commanding 1st Devon Volunteer Engineers.

HOW SHALL WE BUILD OUR CHURCHES?

Some time in 1851 I addressed, through your columns, a challenge to the late Mr. Welby Pugin, to meet me before the Institute of British Architects, and discuss, *vivâ voce*, the points in dispute between Protestants and Papists relative to the arrangements of their respective churches. Mr. Pugin replied, through the same medium, declining my challenge, but stating, that his forthcoming work on "Chancel Screens" would contain a refutation of my views.

On turning to page 22 of his book, under the head, "On Screens in Italy and Spain," I found the following passage:—

"I commence with Italy, first, because it has been the fountain from whence Catholic truth has flowed to other parts of Christendom: and secondly, as I believe it is a very general delusion that screens formed no part of the fittings of a Roman church.

As an overwhelming contradiction to this often-repeated error, I produce a representation of the great screen in old St. Peter's, from the most irrefragible authority, from which it will be seen, that a *double* marble wall was erected, about 6 feet high and 12 feet apart; that on these walls stood twelve porphyry pillars, supporting a transverse cornice, surmounted with standards for lights. Moreover, at the necks of these pillars, under the caps, rods were extended, for the suspension of lamps, which were kept perpetually burning, in honour of the apostles, whose *relics* lay beneath the high altar.

The altar, as will be seen by the plan, stood considerably within the screen, surrounded by pillars, and covered by a ciborium. The back of the altar is turned towards the nave, with a cross and candlesticks upon it, and must have completely concealed the celebrant from the people: behind all this is seen the great apse, with the cathedra for the pope, mosaic ceiling, and usual decorations.

This is the most important authority for the use of screens in the ancient Roman Church; and the dignity and sanctity of the old basilica of St. Peter was so great, that it would be naturally considered as the type for other churches. Moreover, if we except the details which belong to the early period of its erection, it is a perfect type of a pointed screen,—convert the twelve pillars into shafts, surmount them with arches, and terminate them by a bratishing, and we have a work of the Mediæval period."

Mr. Pugin's plates, in illustration of this passage, show the original chancel with the simple old *stone seats*, at its extreme end, and a modern screened affair in front, shutting out the old seats from sight and use.

Again addressing Mr. Pugin in the *Builder*, I pointed out that the youngest clerk in his office ought to be aware that the *style* of the pretended old screen fixed the date of its erection in the fifteenth century; and that he, Mr. Pugin, knew this quite as well as I did, and therefore must accept my congratulations on "belonging to a 'church' which would give him absolution for committing such a bare-faced literary fraud in her honour."

Repeatedly since then, in letters, which have been copied and re-copied, and have thus traversed the kingdom, I have re-stated the facts I have discovered in relation to the old churches, and challenge denial of any one of them.

The Rev. Mr. Purton, in your paper, at last steps into the ring, picks up my glove, and proclaims his defiance to my assertion that "the original place for the 'Lord's table' was in the middle of the church."

Unfortunately for Mr. Purton, he has ventured to bring forward a writer of the fourth century to back his own assertion; and Eusebius, in Mr. Purton's hands, is made to speak exactly the contrary to what he really wrote.

To do my opponent justice, I must quote his own words:—

"The earliest detailed description we have of a Christian temple is given by Eusebius in Book X., chap. 4, of his 'Ecclesiastical History,' written A.D. 325; in which he gives an account of the new church at Tyre, consecrated A.D. 306. After speaking of the atrium, with its cloisters, the baptistery, porticoes, vestibule, and nave, he comes to the bema. This, he says, 'he' (the founder) 'adorned with lofty thrones in honour of those who preside; and also seats, decently arranged throughout' (*i.e.* all round) 'the whole, and at last placed *the holy altar* in the middle. And *that this again might be inaccessible to the multitude, he enclosed it with frame lattice-work, accurately wrought with ingenious sculpture, presenting an admirable sight to the beholders.*" "Here," continues Mr. Purton, "we have express mention of the holy altar standing 'in the middle' of the apse, shut out and made 'inaccessible' from the nave by the 'cancelli.'"

Now, then, let us hear Eusebius himself: "Furthermore, when he had thus finished the Temple, and adorned it with thrones, which he erected in the highest or chiefest place, in honour of the presidents, and also with lower seats, placed in decent order *all over the Temple*. He at last placed the holy of holies, to wit, the altar, *in the middle*, which he made every way inaccessible to the multitude by a separation of network of wood, wrought and carved with such accurate skill and art as makes as wonderful a spectacle as eyes can behold."

It will be observed that Eusebius, first mentioning the "presidents'" seats, which invariably stood at the extreme end of the church, then proceeds to describe the seats for the congregation all over the Temple, and at last the altar "in the *middle*."

By dexterously substituting "bema" for "temple," Mr. Purton converts an authority, which fully establishes my statement, into one diametrically opposed to it.

It is true that Eusebius uses the terms "altar" and "temple," and that other writers of the period do so also. Chrysostom taxes the Christians of his day with being more than half Jews in their opinion, and a fierce controversy prevailed as to whether Christian rites and ceremonies had their origin in "temple" or "synagogue" models; the archbishop in question taking the latter view. It is quite clear that such a dispute arose from the efforts, first, of individual bishops, and alternately of the whole order, to change their original position of officers in a community of "brethren" and equals, into that of lords and masters.

Every type and symbol referred to by the Apostles, and every word used by them in its direct application, conveyed the assurance that the Christian community was a royal company of "kings and priests," and that thus, as Ireneus subsequently assures them, every man was of the "sacerdotal order." There is not even the shadow of a doubt that the model selected, and so universally used, was chosen because it illustrated and accommodated the ideal of a free and equal assemblage.

There is a certain sense of "fitness of things," which produces like results in all ages and countries. Thus all "temples" have this one arrangement in common, that they are places designed exclusively for the reception of a "caste," and illustrate the idea that the people could only address the object of their worship through the intervention of priests. On the other hand, a free people invariably design open halls, with nothing in them to indicate or accommodate a "caste."

If the primitive Christians had not found such a model in the Roman basilica ready to their hands, they would assuredly have originated one exactly similar.

There cannot be a more striking illustration of the force of this universal principle, than the fact that the "Knights Templars," who claimed to be all "priests," in the church they designed for their own use, laid aside the Mediæval model, and built a simple hall. The Temple Church in London is thus purely primitive and Protestant in its principle of arrangement.

All the writers on church antiquities I have met with fall alike into the error of mixing up, in one description, arrangements and names, of different dates, and due to two totally opposite principles of arrangement.

The ludicrous incongruity of using "holy of holies" and "chancel platform;" "temple" and "conventus," or "meeting hall;" "table" and "altar," as synonomous terms never seems to have struck them; and thus the sight of a genuine old church, stripped of its modern additions, creates as much astonishment in a certain class, as Lord Dundreary experienced when the whole article was brought to his notice—"Oh! that's a cucumber, is it? Well, I always thought they grew in slices."

The passage of Eusebius I have quoted, taken in connexion with the existing state of the Constantine churches, explains the whole mystery which had long puzzled me, both as an architect and a student of Christianity.

I could easily bring forward a chain of proof that the Christian system demanded a "table" in the midst of the people. Eusebius proves that in his day this custom still existed, and he designates the table or "altar," as he chooses to call it, the "Holy of Holies." It is immaterial to the argument at what precise period this "table" was moved from its time-honoured position, among the people, on to the minister's platform: it is indisputable that no "chancel" in any church previous to the tenth century was ever designed for any other use than that of giving raised seats to the presiding officers; and that wherever such a spot was made to accommodate the "table" it was by subsequent enlargement; and then the "table," or stone tomb, as it often became after the fourth century, took with it the exaggerated terms of sanctity rhetorically applied to it.

When taunted by their Pagan neighbours with having no "altar," the Primitive Christians candidly admitted the impeachment, in the well-known words—"Altars and shrines have we none."

They knew well that the "spiritual sacrifices" they offered up required a "spiritual altar,"—"Christ." There was an exact parallelism between the symbols last referred to and those gathered from the "Temple." Thus "the Father," the Great Architect of the universe, provides the site,—the "Son of God" the "rock,"—which, in His earthly nature the son of a builder he builds Himself up into a perfect "Temple" starting the work of the great aggregate spiritual "Temple" as the first individual perfect living "Temple," the "chief corner-stone," with "the apostles and prophets" as "foundation-stones" on which each successive stone was to be laid. The apostles, as the first successful "master builders," were permitted to draw up the rules by which the future "stones" were to be squared and every future "stone" was to be bound and bonded in to the "walls of salvation," if fulfilling the conditions of the apostolical specifications, and using as materials the "gold and silver" of God's words, and not the "hay and straw" rubbish of rascally "contractors" offering to do the job at cheaper terms.

If laid within the "lines of judgment," and bearing the test of the "plummet righteousness" every successive stone was also in itself a perfect living "Temple,"—Christ its "rock," its pattern its "altar," its "door;" faith and repentance being the "keys" of admission into the outer "sanctuary," the Church on earth; and "His flesh" its "veil," through which, at last, entrance is to be given into the presence of the real "Holy of Holies,"—"God." Of such a "Temple" who can be the "priest," save Him who builds *Himself* up into a "Holy Temple to the Lord"?

The question in dispute is clearly one in which the opinion of architects is valuable, because it is utterly impossible for any honest man, familiar with antiquities, and aware therefore of the inevitable nature of religious customs, not to see that people trained in temple rites and customs would as soon have thought of stripping the skin from their bodies as of changing a model arranged solely for sarcerdotal priests and a material sacrificial for an open hall, with the table, or "Holy of Holies," as Eusebius calls it, in the *midst of the people*.

It is clearly for the advocates of the materialisation of Christian spritual things to account for the interregnum, however short it might be, between the old use of "temples" and the conversion, during the Middle Ages, of "chancels" into "temples," added on to a "meeting hall." At events they have got this FACT to dispose of, that every single thing, in any church before the tenth century, which now appears to favour their views, came to it as an addition of comparatively late date.

That a rite indicative of the kingly dignity of those sharing in it was converted into a symbol of "bondage," and that those who were at one period the "elder brethren" of the people, came in time the "lords over God's heritage," is an historical fact, as true as that one, even of the Apostles, betrayed his Master with a kiss.

Mr. Purton is not content with being wrong in one instance: nothing short of total error will content him. It is not true that only in the "adapted basilicas," the orientation principle was avoided: there is, I believe, no single instance of a church erected by the early Christians standing east and west, without the entrance being at the east end, the chancel at the west.

It is certainly amusing to see Mr. Pur

arguing, all through his letter, that no change had occurred between a Mediæval chancel and an ancient one; and then stating that it is an "insult" to your readers to imagine that the Church of England, in directing that the chancels "should be as in times past," meant the old chancels. Does Mr. Purton know or forget that the Church of England condemns as "idolatrous and blasphemous" those doctrines of Rome which originated the Mediæval (so called) "chancels," and then passed an equally strong judgment on them, and not merely in words, but by deeds also deprived them of their chief distinctive features, ordering all "screens" to be taken down, all "altars" to be destroyed, and the "table," when required for use, to be brought out of the "chancel" into the "nave"?

I leave it to your readers to decide who it is that has not only insulted their common sense, but their common honesty.

JOHN ELLIOTT.

ARCHITECTURAL LIBRARIES.

"ARCHITECTUS" has drawn attention, through your columns, to the excellent collection of books in the South Kensington Museum.

May I be allowed to point out another very valuable, and perhaps more accessible, collection, which includes a large number of architectural works, but is far less known and used than it deserves. I allude to the library of the Commissioners of Patents.

This library is in the heart of London, in Southampton-buildings, Chancery-lane; and it is entirely free, any person having liberty to consult it on entering his name in a book. Besides standard volumes, nearly if not quite all the architectural and engineering periodicals published in England and on the Continent are to be found there; and a most attentive and efficient staff of assistants will afford the reader every facility he can require.

It is also not, I believe, generally known that the splendid collection of maps belonging to the Royal Geographical Society, in Whitehall-place, is open to the use of all applicants without fee or introduction: such was, and I believe still is, the case.

VULCAN.

ARTISTIC NATURAL THEOLOGY.

SIR,—The subject of what your correspondent "X" terms "Artistic Natural Theology," has not been so neglected as he thinks. The paper read by Mr. Cave Thomas at the Antwerp Congress grasps this subject, and the views it contained were deemed of sufficient importance to obtain for it the distinction of being printed in two languages in the *Comple Rendu* of the Congress, and at full length in the *Builder*. This paper was necessarily but a brief sketch of those views which have since been published *in extenso* by Ellis of King-street, Covent Garden, under the title of "The Holiness of Beauty and the Conformation of the Material by the Spiritual," reviewed in your columns, and those of other leading journals.

Mr. Thomas's book deserves to be read, and I commend it to the notice of those who may be interested in the subject of your correspondent "X.'s" letter of last week. I hear of a work entitled "Formative Ethics," as "preparing for the press," by the same author, and which, I imagine, bears upon the same subject.

DELTA.

BLIND LOCAL BOARDS.

SIR,—You have shown up the doings of "blind builders;" now, I think there are others in the dark as well as some builders are, as the following will show: it is copied from the *Oxford Journal*, of the 28th ult.:—

"*Witney.—Local Board.*—Mr. THOMAS ANDREWS, *baker*, of this town, has been appointed by the Board their Surveyor and Collector."

Whatever shall we hear of next? Surely there is a wide difference between bread-making and road-making, without saying anything about many other duties requiring the attention of a surveyor to a local board, if carried out efficiently.

EVERY ONE TO HIS OWN TRADE.

INSULT TO THE PROFESSION.*

SIR,—The surveyor to the Board of Health at Ely has very wisely obtained a better situation, and resigned his old berth, where he has had no sinecure. The nature and amount of the work required from that officer is detailed in the advertisement in your journal of last week; whence it may be learned, that the district comprises 17,000 acres, 1,600 houses, and 14¾ miles of highways, and that the happy man, who, basking in the smiles of the Board, may be favoured with the appointment, is to hold three offices rolled into one; viz., "Surveyor," "Inspector of Nuisances," and "Superintendent of Highways;" *is to give his whole time to the Board*, and to receive the munificent salary of 120*l.*, being at the rate of 1¾d. per acre per annum over which he is to exercise his vigilance, and for which he will be permitted to do all the other duties gratis. But, in case it may be thought that this number of broad acres is merely placed under his charge, so as to give him an opportunity of disporting himself over them with his greyhounds, just by way of obtaining healthy recreation, and that his work is confined to the urban part of the district, then his pay will be at the rate of 1s. 6d. per house per annum, and no pay for attending to the 14¼ miles of road, or the other duties which are detailed in the following schedule:—

1. All the duties comprised in the Public Health Act, 1848.
2. Do. in the General Highway Act.
3. Do. in the Nuisances Removal Act, 1855.
4. Do. in the Local Government Act, 1858.
5. Do. in the several Acts incorporated with the foregoing.

It is indispensable that the surveyor must be familiar with,—

6. The construction and working of steam engines.
7. Furnaces for the consumption of smoke.
8. Filters.
9. Works of water-supply.
10. Sewerage by tubular pipes.
11. House drainage.
12. The making and management of roads.
13. Streets.
14. Pavements.
15. Scavengering.
16. The taking of levels.
17. The value of labour and materials.
18. The preparation of plans.
19. Do. of specifications.
20. Do. of estimates.
21. All such works as come within the province of a local board of health.

When the expense of a professional education, and the heavy responsibilities of the office, are considered, can it be expected that the Board, by offering a minimum of salary for a maximum of work, will be likely to obtain the services of an educated and properly qualified gentleman? Certainly not, if the profession have any respect for themselves.

This grinding transaction is the more surprising from the fact that many of the cathedral dignitaries and their functionaries are members of the Board, and they have never rendered themselves notorious by being underpaid themselves for the amount of work they do, or for giving to their superiors "a bond for the due performance of the duties" of their office, although they demand one from their surveyor, "himself in 200*l.* and two sureties of 100*l.* each."

When a man is precluded by the Board from opening an office on his own account, and is thus bound hand and foot, and overworked, who is to decide that he has duly performed the duties of his office?

When I remember the profuse liberality of my monks of old, who believed in and acted up to the Divine injunction, "*Do as you would be done by*," and compare that with the wretched parsimony of their more wealthy descendants, I am in sorrow constrained to ejaculate, "What a falling off is there!"

THE SHADE OF ETHELDREDA.

* This is one of five indignant letters on the same subject.—ED.

PATENTS CONNECTED WITH BUILDING.

RAIN-WATER PIPES FOR BUILDINGS.—*J. Taylor, jun.* Dated 27th March, 1863.—The patentee forms the lowest length of the number of lengths of pipe which together compose a rain-water pipe, and the bottom end of which descends into the trap, of greater diameter than the other pipes, in order that if there be any obstruction in the trap, or in the pipe, this lowest length may be slid upwards over the length of pipe above it, and thus leave a space between the trap and the lower end of the rain-water pipe; so that any matter that had accumulated in the trap can then be readily removed from it, or any obstruction in the pipe can be pushed out at its end. The movable length of pipe is formed with lugs or projections upon it, by which the pipe when raised can be held up, and by which also it is carried when in its lowest position. The rain-water pipes of buildings may also in a similar manner be made with one of the intermediate lengths of the pipe movable, and this is a convenient arrangement when no trap is employed. For this purpose the length of pipe which is to be movable is made of greater diameter than the other pipes, so that it may be slid over the pipe above, but at its lower end it is contracted, so that it may there enter into the socket of the pipe below it. The movable length of pipe is, as in the former case, made with projections upon it, by which the pipe when raised can be retained up.

MANUFACTURE OF TILES.—*W. Clark.* A communication. Dated 23rd April, 1863.—This invention consists, first, of cylinders having circular grooves, and gearing one with the other, for cutting up and crushing the material to be used. Secondly the apparatus is furnished with a pressing box and draw plate, which receives the material from the cylinders and draws it out, so as to form a cake or sheet, which is then hardened by pressure exerted by an eccentric receiving motion from a piston to which it is jointed. Thirdly, the apparatus is furnished with a cast-iron mould for receiving the sheet of clay, in order to form the tiles. This mould is placed in a press acting vertically, in which the sheet of clay receives an energetic pressure, which reduces it one-third of its thickness, and so causes it to take the exact form of the cast-iron mould. Tiles manufactured in this way are then trimmed round, and exposed for a few days only to the air, in order to partially dry them, after which they are placed in ovens to be baked, as in ordinary cases.

Books Received.

The New Path. 1 *to* 6. 97 East Twenty-ninth-street, New York, U.S.

THIS is a monthly publication, 8vo. in size, avowedly to spread the principles of the so-called pre-Raffaellite School in America. It proceeds from an "Association for the Advancement of Truth in Art." The views of the founders may be learnt from this paragraph in the Introductory article:—

"The new path into which the best minds of the present day summon the young to enter, is the earnest loving study of God's work of nature. This is not only taught to the artist, but to the writer, the poet, and the teacher. It is the moving spirit of the age in which we live; an age greater in all essentials than any that has preceded it, second to none in the purity and strength of its religious ideas, to its love of man, which is the best fruit of its love of God, in its tolerance, its enthusiasm, its energy, and in the wide-spread diffusion of wealth and education, which are saving it from selfishness and dilettanteism.

A few individuals persuaded of these things have joined themselves in a society, for mutual strength, and for the better dissemination of these ideas. They propose to print, from month to month, a journal, in which they can communicate with others who think with them, or may be led to do so."

The writing at present is for the most part a reflection of much that has been said in England.

VARIORUM.

The Christmas number of *All the Year Round*, conducted by one to whom we all owe a great debt for healthful delight, one who has given us more ideal friends to love than any other living writer, the perennially genial Charles Dickens, does not need mention by us, the large majority of English readers looking for it as a matter of course, and intending to buy it, quite sure of getting much more than value for the 4d. expended on it. Last year, if we remember rightly, the sale reached 200,000 copies. We shall not be astonished if it touch a quarter of a million this. Suffice it for us to say that it is called "Mrs. Lirriper's Lodgings" (as if any one did not know it?), and that besides the hearty proprietor who, in the shape of "me and the major," keeps house characteristically, every floor in that No. 81, Norfolk-street, Strand, is occupied by a good hand, who does his best to make the "Lodgings" agreeable. We see with pleasure, and go out of our way to mention it, that Mr. Dickens is about to issue a new serial story in parts, uniform with the original edition of the immortal "Pickwick."——Messrs. De la Rue & Co. have published their elegant little calendars and pocket-books, with indelible diary, the latter of all sizes in leather and satin; dainty books for the daintiest lady. They are edited by Mr. Glaisher, and contain a photograph of the moon, with a notice of our Satellite, by Mr. Hind. —— *Fraser's Magazine* has a well-timed article under the heading "Plays, Players, and Critics," directed against the preposterous praise mistakenly given lately to some idols of the hour, and calling at the close, as we have before now desired, for the foundation of a theatre where the histrionic art might be maintained at its highest level aloof from sordid aims. The writer suggests that this would be the best monument to mark the tercentenary of Shaks-

peare's birth.——The *Ecclesiologist* has an illustrated notice of the Dutch church, Austin Friars. ——The bound volume III. of "The Children's Friend" (Seeley), gives for 1s. 6d. a large number of admirable illustrations, with moral and religious stories, maxims, and anecdotes. It must need an immense circulation to pay the cost. The Hieroglyphical Readings are a good notion; well calculated to exercise the powers of children. ——*The Band of Hope Review* (Partridge) has also the advantage of very excellent illustrations. The part for the year, with a coloured cover, includes a capital likeness of George Cruikshank, to whom it is dedicated.——*Young England* (Tweedie), maintains its course, and justifies the good things that have been said of it in many quarters.——The "Publishers' Circular," for the current month, contains with its usual lists, a large number of engravings from illustrated works of the season.——Under the title, "The City Diary and Almanac for 1864," a new diary and year-book, specially adapted to the citizens of London, has made its appearance. It comprises the names and addresses of all the members of the corporation, the City offices, courts of law, unions, halls or offices of the civic companies, with the clubs, presidents and officers of the royal hospitals, ward clerks and beadles, a calendar of local and general events, and a mass of other matter, in a convenient form for reference. The space given for each day is scarcely enough. The Diary is in a stout cover, and interleaved with blotting-paper.—— The Christmas number of "London Society" (a second number in the month) is singularly rich in illustrations, and has some very good stories. Its cheapness is marvellous.

Miscellanea.

Petroleum.—American rock-oil is now exported to almost every quarter of the globe. From the 1st of January until the close of October, 1862, there were 5,195,481 gallons shipped from New York alone. For the same period this year, New York has exported 15,503,166 gallons; Philadelphia, 4,268,244 gallons; Boston, 1,604,846 gallons; Baltimore, 806,961 gallons. In round numbers, the total value of the exports from the ports above-named, from January 1 until the close of October, will not fall short of 10,000,000 dollars.

Shakspeare's Celebration.—At the general meeting of the National Shakspeare Committee, held on Monday last, it was announced that the Archbishop of Canterbury, the Archbishop of Dublin, the Duke of Devonshire, Lord Brougham, and the Lord Chief Baron of the Exchequer, had accepted office as vice-presidents of the Association. A site committee was appointed, "to consider the principles which should govern the selection of a site for a Shakspeare memorial, to inquire into the number of appropriate sites, and ascertain which of them may be obtained, and on what conditions, for the purpose of erecting a public monument of a large and noble character."

Bois de Boulogne Hotel.—The directors of the Bois de Boulogne Hotel and Land Company have appointed as their architect Mr. John Giles, of Verulam-buildings, Gray's Inn. The intention of the company, as we have before noticed, is to erect two new boulevards and a hotel, which is to be the "Star and Garter" of Paris; upon land overlooking the Seine at an easy drive from Paris through the Bois de Boulogne. The amount of land ceded to the company is upwards of 130 acres, part to be laid out and let to private persons and speculators, and part to be covered by the new boulevards and hotel. The situation is one of the most beautiful near Paris, and the land is said to be moderate in price.

The Wire-fence Trap for Fox and Hare Hunters.—Farmers have discovered that wire-fencing is a cheaper and more effectual fencing for fields than post and rail fencing, and are fast covering the country with what the hunting gentry regard as little better than men and horse traps; because they cannot clear what they can scarcely see, we presume, and are hence effectually hindered from encroaching on the farmers' fields. Threats of coercion have been uttered by some who fear that an end is about to be put to hunting in the field; but others have pointed out that such threats are of no force, and advise a friendly understanding with the farmers and the temporary removal of the fences after the crops are off the ground, or from November to April, the removal and replacement to be at the cost of the sportsmen.

A Big Stick of Timber.—Some time ago a splendid stick of white oak timber was landed at the Globe Works, Boston. It was one of the largest ever brought into Boston. It measured 66 feet in length, and was hewn up square, on the average, 28 inches by 29 inches. It contained 370 cubic feet. Its actual weight would not be less than 12 tons. It was brought from the State of New York.

The Corporate Income of Liverpool.—The net income of the corporation of Liverpool for the year has been 124,528*l.*, and the expenditure classified as obligatory amounted to 91,471*l.*, leaving a surplus, in round numbers, of 33,056*l.* The following payments have been made out of the surplus for the year ending August, 1863:— General improvements, 13,689*l.*; Botanic Gardens, 1,500*l.*; public schools, 2,500*l.*; park, 500*l.*; new baths, Everton, 425*l.*; in aid of the lighting rate, 13,700*l.*; in aid of the fire-police rate, 1,531*l.*

Hebrew Monuments and the Jews.—Certain discussions at the Institute relative to the age of Hebrew monuments, have suggested a new exploration of Jerusalem and other cities in Palestine. M. de Sauley, Abbé Michon, and Mr. Saltzmann start this month on this interesting expedition. The 20,000 francs prize decreed by the Emperor for the most important discovery in science, was adjudged this year by the Institute to M. Oppert, a Jew, for his persevering labours and success in decyphering the cuneiform inscriptions. The coincidence is striking, that a Jew should be the unfolder of Babylonian and Assyrian documents. *Letter from Paris.*

The New Act on Savings' Banks.—On Saturday week, the new Act on Savings' Banks, passed in the late session, came into operation. The law is now amended and consolidated into one statute. The new Act is not to affect Post-office Savings' Banks. The interest to be paid by the Government to the trustees is to be 3*l.* 5s. per cent. per annum, and the interest to depositors is not to exceed 3*l.* 0s. 10d. per cent. Infants and married women can make deposits, and should the husbands of the latter give notice, the money is to be paid to them. All depositors are restricted to one savings' bank, on pain of forfeiture. The interest to be calculated half-yearly, on the 20th November and the 20th May, and to be added to the principal. No new bank is to be formed without the approval of the National Debt Commissioners. The rules are to be certified by the barrister appointed. In the event of death or bankruptcy of any officer holding money, the trustees are to be the first paid out of the estate.

Restoration of St. Mary Redcliff Church, Bristol.—The committee of the Canynge Society, in a report they have just issued, state that, "in consequence of the severe domestic affliction under which the president, S. W. Lucas, esq., had been suffering, it was found impossible to make the necessary arrangements for holding the general meeting during the last summer; and as Mr. Lucas kindly consented to continue president until after the next anniversary, it has been determined to postpone the meeting until 1864, when it is hoped, as a slight acknowledgment of Mr. Lucas's munificent donation towards the restoration fund, that all those who are interested in this work will support him by their presence. The committee are happy to announce that since their last report the restoration of the church has steadily progressed. The north side of the lady-chapel, the whole of the flying buttresses of the clerestory, six of the side windows, the large north window, and the exterior end of the north transept, are completed. The ceiling of the north transept has been cleaned and restored: the columns of the chancel have been restored; also one bay of the screen on the north side. The parapet of the tower, which was in an unsafe state, has been repaired. The north-west clerestory is now in progress. The flying buttresses are completed, with the jambs and arches, and the panel work above is in course of restoration. The east window of the north chancel aisle, intended as the Handel commemoration window, is now in hand by Messrs. Clayton & Bell. All the old pews have been removed, and the paving made good, ready to receive the new seats. A new Pennant stone staircase to the organ gallery has been erected. Seeing the magnitude and importance of the work in which the restoration committee are engaged, it behoves the Society to continue its efforts in providing the necessary funds." The subscriptions for 1862 amounted to 152*l.* 16s., and the donations during the same period to 65*l.* 9s. 10d., which includes a collection of 39*l.* 2s. 10d., at St. Mary Redcliff, after a sermon by the bishop.

Steam Cultivation in Egypt.—A considerable number of steam-ploughs and other implements have been sent to Egypt, with a view of preparing the land for the growth of cotton.

Proposed Hotel for Eastbourne.—A new hotel, with baths, is shortly to be erected at Eastbourne, the drawings and particulars being now far advanced. The site selected is on rising ground westward of the Grand Parade, the soil being the green sandstone rock. The frontage towards the sea is 230 feet, and that towards the roads, right and left, which flank it, 110 feet. The new part of Eastbourne where this hotel is to be erected has a series of terraces opposite the sea, rising one above the other, and which make upon the stranger a strong impression. The estimated cost of the building is 30,000*l.*, and the architect is Mr. Knightley, of London.

Townhalls.—The erection of a townhall for Edinburgh is mooted in the *Scotsman*. Mr. Rhind, the architect, proposes to acquire from the Bank of Scotland the ground which belongs to them to the east of their head-office, and to construct there a terrace to run parallel with North Bank-street, diverging to the south in a new street which he proposes to form immediately opposite St. Giles's Church. To the south of the new terrace Mr. Rhind proposes to erect the town-hall, with its front facing Prince's-street, and the architecture is to be of such a nature as will be in keeping with its surroundings. Other portions of the suggestion provide sites for Trinity College Church, the Albert Memorial, &c.——The Treasury, it is understood, will give 3,000*l.* towards a town-hall, at Merthyr, in Glamorganshire, Wales, for the accommodation of the County Court Judge, offices, &c. A Government official has inspected the proposed site, opposite the Castle Hotel, and gives a favourable report.

Ventilating Mines.—To ventilate mines by means of steam and heated air, without the use of open fires and furnaces, has been provisionally specified by Messrs. Evans, of Cefn Mawr, and Griffiths, of Merthyr Tydvil. They propose to erect, contiguous to the upper part of the upcast shaft, a tower or structure open at the top (except as hereafter stated), and they lead from the lower part of this hot-air tubes in communication with a fire-clay pipe, formed at one or each side of this furnace in the form of a channel, the air in the pipe being thus heated in the furnace, and supplying the interior of the tower in the lower part; and they prefer to carry a steam-pipe from the top of the said steam-boiler into an upper point of the interior of the said tower, at the end of which steam-pipe they provide a steam-box, with a ring of jet-pipes projecting upwards, and at the top of the tower there is an inverted cone, for regulating the draught. The bottom of the tower is made inclining to the centre, so as to form a drain, to carry off any condensed water. Instead of placing the furnace and boiler outside the tower, or structure aforesaid, they can have it, or portions of it, placed within the tower.

The Tees Breakwater.—The foundation stone of a new breakwater, at Stockton-on-Tees, has been laid by the chairman of the Tees Conservancy Commission. The plans are for the construction of two curvilinear breakwaters; one line extending from Tod Point, on the southern shore, across the Bran Sand, to the Checkered Buoy, a distance of about 4,300 yards. From the site of the First Black Buoy the line of works will extend over the North Gare—a distance of 2,000 yards, terminating at the Seaton Snook. The entrance to the channel between the ends of the breakwaters will be about 600 yards in width. The total length of the breakwater will be about 6,600 yards, the average height about 15 feet, and the width at the top 40 feet. The breakwater was commenced at the beginning of the present year, and already considerable progress has been made. It is constructed in rubble, the material used being, as we have before noticed, the slag from the iron furnaces in the district. The slag is moulded into large square blocks, weighing about 3 tons each, and whilst they are in a red-hot state are conveyed to the breakwater and "tipped." The mode of constructing the breakwater is similar to that adopted with the Plymouth and Cherbourg breakwaters. In the conveyance of the slag from the furnaces two locomotives and 500 iron bogies are fully engaged. The amount required to carry out the scheme is estimated at 130,000*l.*, of which 30,000*l.* have been obtained from the Public Works Loan Commissioners. If constructed in stone it was estimated that the building would have cost 600,000*l.* A grand banquet took place in the afternoon at the conclusion of the ceremony of laying the stone.

THE LATE MR. J. D. HARDING.—We hear with great regret of the death of this distinguished artist, in the sixty-seventh year of his age. It took place at his residence, in Barnes, Surrey, on the 4th inst. Mr. Harding was a pupil of Prout, and was one of the first to employ lithography for the multiplication of his studies of landscape for the use of others. Several of his published works are extensively used as text-books for pupils. All frequenters of the Royal Academy and the Gallery of the Society of Painters in Water-colours know his sparkling pictures.

MANUFACTURE OF CAST-IRON.—An invention which consists essentially in mixing with melted pig or cast iron, which it is intended to form into castings, a quantity of melted steel, semi-steel, or malleable iron, which said metal has been obtained from refining or decarbonising melted pig or cast iron by the pneumatic process, in order by this admixture to strengthen and improve the quality of the said pig or cast iron, has been patented by Mr. Robert Mushet, of Coleford. He does not claim the addition of malleable iron in the solid state, made by the puddling process, to pig or cast iron, and the melting of these substances together in order to improve the quality of the pig or cast iron, as he is aware that this has already formed the subject of a patent claim.

EMIGRATION TO THE "BRITAIN OF THE SOUTH." The ninth edition of "The New Zealand Handbook or Guide," by Messrs. Willis, Gann, & Co., of the New Zealand offices, in Crosby-square, has been published by Stanford, of Charing-cross. Although issued under the auspices of agents interested in emigration to New Zealand, this is a well-written and useful compendium of information as to a now favourite colony, which only needs a right and quiet understanding with the natives to render it all that can be desired. The unsettled state of the colony, however, is restricted to a district of the north island, and does not affect the south, which includes the more English district of Canterbury and the more Scottish district of Otago. The little Guide under notice has a map of New Zealand, and one of the world on Mercator's Projection showing the different routes to and from New Zealand and Australia.

CONTRAST OF COLOURS.—A short time ago, M. Plateau sent in a paper to the Academy of Sciences, in which he concluded that M. Chevreul's law of the simultaneous contrast of colours was not applicable to one particular case, viz., that when, from a certain distance, a very narrow streak of colour is viewed on a ground of another colour, it seems to combine with the colour of the ground, instead of appearing modified by the complementary colour of the ground, as it ought to do by the law of contrast. This law, as stated by M. Chevreul, is as follows:—1. The mixture of two simple colours gives a pure binary colour, viz.,—orange, by red and yellow; green, by blue and yellow; and violet, by blue and red. 2. Three simple colours, or two colours which are complementary of each other, give either black or a normal grey, composed of either red or green, yellow and violet, or blue and orange. 3. If the proportion of the three colours, or of two complementary ones mixed together, do not give black or a normal grey, because of the predominance of one of the colours, then the result of the mixture is either black or grey, with a dash of the dominant colour in it. Now, if two zones of different colours and the same dimensions be placed in juxtaposition, and two other zones of the same colours respectively be placed separately, and at some distance from each of the former, in order to judge of the effect, it will be found that a simple colour can only be modified by the addition of one of the two other simple colours, and that a binary colour can only be modified by one of the two simple colours of which it is composed. Again, as to simultaneous contrast, when two zones, placed side by side, and differing both in tone and colour, are seen simultaneously, the lightest loses a part of its colour, and the darkest increases in intensity, while the colour of each assumes a shade of the complementary colour of its neighbour. Hence the principle of contrast is diametrically opposed to that of mixture, and M. Chevreul explains M. Plateau's phenomenon by saying "that, when the eyes of the spectator distinctly see the forms and colours of the model reproduced, at a distance where the finite extent of each element of colour ceases to be perceptible, then the effects of vision no longer belong to the principle of contrast, but to that of the mixture of colours. So that, in M. Plateau's narrow streak, its colour is mixed with that of the ground, when the distance is such that the outlines of the streak are no longer perceptible.—*Galignani.*

THE "CITY (OF LONDON) ARCHITECT."—We are told that the Corporation are more than disposed not to fill up the post rendered vacant by the lamented death of Mr. Bunning,—to have no *architect*, in fact, but to appoint a *surveyor* at 1,200*l.* a year, with four assistants, at fair salaries, and to send to competition all works for which they require designs. Should they take this step they may prepare to be always in hot water. It is to be hoped they will be better advised.

QUANTITY OF TURPENTINE NECESSARY TO DRY GAS TAR.—"A Friend," Limerick—1. How much turpentine to the gallon of gas tar should be put as a drier? and can I use anything to change its colour to brown or yellow, and what, and how much?——About a pint of spirits of turpentine to the gallon of tar: if required to dry very quickly, you may add more. Yellow ochre may be added in quantity at pleasure, to change the black to the several shades of brown; but to render the colour yellow is impossible.

TURKISH BATHS.—The half-yearly meeting of the shareholders of the London and Provincial Turkish Bath Company has been held, at the premises of the company, named the Hammâm, 76, Jermyn-street, when a dividend, at the rate of 6 per cent. per annum, was declared. In the course of the meeting, Mr. Crawshay asked why the dividend declared was not 8 rather than 6 per cent., seeing that the profit earned seemed to fairly warrant the larger rate. The chairman explained that, being a young company, it was thought better to keep an available balance in hand to meet any contingencies. The chairman also stated that, satisfactory as the present state of the company's affairs now is, it would become much more so if additional capital of about 8,000*l.* were subscribed, to enable the directors to carry out what was contemplated, for developing and increasing the resources of the establishment.

THE ROYAL EXCHANGE CLOCK.—The colossal proportions of some of the clocks in our chief churches and cathedrals would surprise most persons who have not made a personal examination of them: for instance, as regards the Royal Exchange clock, which was manufactured by the late Mr. Dent in 1843, and which has since been pronounced by the Astronomer Royal to be the best public clock in the world; the pendulum, which weighs nearly 4 cwt., is compensated, and the first stroke of the hour is true to a second. This clock has Mr. Airey's construction of the going-fuzee introduced, by which the winding is effected without stopping the motion. This clock is a great improvement on that placed in this building in Sir Thomas Gresham's days, respecting which it was reported, in 1624, that, "the Exchange clocke was pr'sented for not being kept well, it standing in one of the most eminent places in the Cittie, and being the worst kept of any clocke in that Cittie." This clock still bears a very high character, and it is worth while to remark that Mr. Dent, who became so famous a horologist, was originally employed as a candle-maker. John Scott, the well-known engraver of sporting subjects, was also employed in the first instance in the same business.

PNEUMATIC DESPATCH TUBES.—It is now proposed to lay a tube from the Euston Station, through Woburn-place, Southampton-row, and King-street to Holborn, and thence along Holborn, Skinner-street, and Newgate-street, to the General Post-office. This tube is to be of cast-iron, 4 feet high and 4 feet 6 inches wide, internally. When completed, the transmission of all letters in bulk between the General Post-office and the North-Western Railway will be effected by its agency, as will also large parcels of goods, for which Pickford & Co. have arranged, an extension to their depôt in Gresham-street being contemplated. Mr. Haywood, the engineer to the City Sewers Commission, has presented a report to his Board on the subject. He states that, assuming the pneumatic system to work satisfactorily, it will probably become a valuable auxiliary to the commerce of the city, and be the means of freeing the streets of much goods traffic. But, he says, the laying of the proposed tube through the crowded streets will cause the greatest public inconvenience, for its size will be that of a large sewer, and its depth must be greater than that of the street sewers, inasmuch as it cannot be allowed to interfere with the house drains. Besides, the present occupation of the surface by gas, water, and telegraph pipes will, he apprehends, preclude the possibility of the tube being laid at a less depth. The inconvenience will be the most felt in Newgate-street, for while the work is in progress the traffic there could hardly be allowed to pass in both directions.

LIVERPOOL ARCHITECTURAL SOCIETY.—The fortnightly meeting of this Society took place on Wednesday night, the 2nd inst., Mr. Weightman presiding. The secretary read a communication from Mr. Vaillant, acting secretary to the fund for the erection of a memorial monument to the late Mr. James Murray, requesting this Society to assist in the object by subscriptions. Mr. Audsley read a paper on "Christian Symbolism as applied to Art;" and at the close of his remarks, which were illustrated by designs, some discussion took place respecting the subject of which the paper treated.

WORKING MEN'S CLUBS FOR BETHNAL-GREEN. A meeting has been held in the Town-hall, Bethnal-green, for the purpose of establishing a club for working men in the district of St. Matthias. Sir Thomas Fowell Buxton presided. The Chairman, in opening the proceedings, referred to the self-supporting principle of these clubs, and said he trusted that the club for St. Matthias would prove a blessing to the working people of the neighbourhood. Mr. Solly, the secretary to the Working Men's Club and Institute Union, mentioned that the firm of Truman, Hanbury, & Co., had sent 20*l.* to the club in Peel-grove, Bethnal-green, preliminary help in the way of funds being generally needed in the formation of the clubs. A provisional committee was formed.

CLARK'S SAFETY RAILWAY BRAKE.—An experimental trial of this brake has been made on the North British Railway, and the following is the result as given by the *Edinburgh Courant*. The train consisted of five loaded carriages. The engine was one of the high-speed mail class, with 6-feet driving wheels. The first stoppage was made on the gradient near St. Margaret's, of 1 in 75. With a speed of above 40 miles per hour, the train was stopped in about 300 yards: and on the level, at a speed of 30 miles per hour, the train was stopped in about 100 yards. Other trials were made equally good. The brake is applied by one man on the tender instantaneously, by simply screwing friction-wheels against the running-wheels of the tender. The brakes, which are fitted to the carriages, are compressed uniformly, so that no concussion is felt in these short ranges, which are about an eighth part of the distance a train can be stopped in by the present brake power.

ACCIDENTS.—By the fall of a floor at Leeds several girls have been injured. Repairs were in progress in the attic, and bricks, &c., had been heaped up to such an extent that the floor gave way. In the room below, which extends the length of the premises, about forty young women were engaged at sewing-machines, when, without the slightest warning, a third of the floor above them, as well as a large quantity of bricks, fell in, completely burying the five girls who were working in that portion of the room. In about half an hour they were taken out and removed to the infirmary. All of them were bruised and injured severely, and one of them was in a dying state. She was literally doubled up.——The roof of the engine shed at the Railway-station, Hawick, fell last week while the men were cleaning the engines: four men were more or less hurt. The roof was of iron, and fell without giving the least warning: it was about 100 feet long, 30 feet broad, and 30 feet from the ground. It is understood that the iron had been corroded by the steam. It is only about thirteen years since it was erected.

AN IRISH STEAM FISHERY.—We have occasionally drawn attention to the deep sea and other fisheries off the coast of Ireland as an inexhaustible and convenient source of fish supply, by railway and otherwise, to the whole country; but hitherto no one seems to have made any great practical use of these rich and profitable fish-diggings. As for the Irish themselves, as we have before said, they seem to agree in opinion with their countryman who thought it would be a pity to "take all the fish out of the sae." A canny Scot, however, it appears, has fairly broken ground on the Irish coast, with a well-appointed steamer, named the *Sir William Wallace*, which he has supplied with all the requisite apparatus for fishing, including a donkey engine, for paying in and out the nets, which are of large size and novel construction. The owner is a Mr. Wallace, who has already been for some time in the north of Ireland engaged in fishing speculations, so that he knows what he is about, and has gone to work in earnest, while the Irish are still merely looking on. The *Sir William Wallace*, until the salmon season opens, will be employed in the deep-sea fisheries, either along the Kerry and Clare coasts, or in the estuary of the Shannon.

Improvements.—The area situate at the corner of Carey-street, Lincoln's-inn, and Chancery-lane, which has for so long a period been left vacant, has been purchased by the Union Bank of London Company, and it is designed to erect thereon a branch establishment of the bank for the locality, and also a range of chambers.

The New Finsbury Park.—At the last week's meeting of the Metropolitan Board, a loan of 50,000*l.* was agreed to for the purchase of the land to form the northern park under the borough name. The price to be paid for the land has been settled by arbitration, and the cost per acre is considerably under 400*l.*; so that the park, which is to be of about 120 acres, will cost less than 50,000*l.*

The Leicestershire Architectural and Archæological Society.—The usual bi-monthly meeting of this society has been held in the Guild-hall, Leicester, the Rev. J. H. Hill in the chair. Letters were read from Earl Howe and other gentlemen expressive of their desire to further the wishes and interests of the society at its intended meeting at Hinckley next year. Various antiquities were exhibited and other business transacted. Messrs. Goddard & Son, architects, produced the plans and working drawings of the schools to be shortly erected in St. Martin's, Leicester, by the trustees of Alderman Newton's Charity.

Fire-Proof Construction. — A patent has been obtained by Mr. Thomas Turner, of Glasgow, for what is called "Improved fire-proof construction for floors, ceilings, roofs, bridges, ships, and other purposes." This construction is, like other fire-proof floors, composed principally of iron and concrete; but the object of the improvement is the more perfect combination of materials, so as to form one united thoroughly bonded mass, and the omission altogether, where necessary, of timber to sustain the concrete, and the straps and laths which are employed as a preparation for plaster ceilings. To effect this, iron joists of open construction are used, and the concrete is arranged to go under as well as over and through the joists.

The Galway Harbour Improvements.—Some difficulties having come in the way of the larger scheme which required a loan of 75,000*l.* from Government, the plans have been materially modified, and submitted for the consideration of the board. In a report from Mr. Roberts, C.E., that gentleman proposes to connect Mutton Island with the mainland by means of a causeway formed by a timber superstructure at a level above the influence of the sea, supported by five massive main piers of masonry, with intermediate piers formed of iron piles. By this arrangement, he says, the connexion between the land and the island may be secured at a cost of considerably less than one-half that of a stone structure. From Mutton Island he proposes that a breakwater should be extended for a length of 750 feet, and that on its inside, for a length of 400 feet, a timber landing wharf should be constructed, forming a berth for one vessel to discharge or load her cargo. The report was adopted, and it was also ordered that the plans be forwarded to the Board of Trade.

Opening of new Lecture Hall at Sudbury. When extensive premises, situate between the Corn Exchange and the Literary Institute, on the Market-hill, were sold last year, it was suggested that part of them might become the site of a public hall, and they were purchased with that view by Mr. J. Alexander. It was at first intended to build the hall by a company, and some shares were taken; but it was found there were difficulties in the way, and Mr. Alexander, in co-operation, we believe, with Mr. W. D. King (both members of the Society of Friends), determined to take the responsibility on themselves. The original shop and dwelling-house were converted into two rooms, a wide passage-way being left between the tenements as an approach to the hall, which was afterwards built in the rear. The dimensions of the hall (inside measurement) are 66 feet 6 inches by 33 feet 6 inches; height 21 feet 4 inches, and it will seat about 500 persons. The hall is lighted by lofty windows at the sides, and ventilation is provided for. It will be heated by stoves placed in the cellars below, and lighted by gas-brackets on the walls and pendant chandeliers, supplied by Mr. S. Wright. The hall is built of red and white brick. The contractor was Mr. J. Holland, builder, Sudbury. The building has been opened with a *conversazione* and exhibition of works of art, lent from the South Kensington Museum, the Art Union of London, and private owners.

New Public Park for Oldham.—The first sod of the Public Park has been cut by the mayor. The object the council has in view in forming a public park is two-fold,—to find work for the unemployed operatives and to provide a park for the people.

Opening of the New Cattle Market, Dublin.—The Dublin Metropolitan Cattle Market has been formally opened by the Lord Mayor. The market stands on 12 acres of ground, and is approached by entrances in Prussia-street and on the Circular-road. There are 134 iron pens erected, and the ground occupied by them is intersected by broad paved walks. Iron tanks for supplying water are placed at convenient distances from the pens. The hotel, which faces Prussia-street, leads into the market.

Sale of Building Land, Brighton. — The Queen's Park, Brighton, has been sold. The auctioneer said he estimated the 30 acres of park land as being worth 30,000*l.*; the late Mr. Attree's villa was worth 6,000*l.*; and the property occupied by Mr. Freshfield, 4,000*l.* The Spa he put at 500*l.*, calculating on twenty-five years' purchase. Therefore, he thought he was within the mark when he said that the property was fairly worth 40,000*l.* It was ultimately sold for 28,000*l.* to Mr. Duddell, Parliament-street, London, who, it is understood, intends it for building purposes.

Original Designs, South Kensington.—Among the recent purchases made by the South Kensington Museum for the Art-Library, is a collection of about 250 original designs by Matthias Lock and Chippendale, part of which were exhibited in the late International Exhibition. Chippendale and Matthias Lock were designers and carvers in wood, who flourished during the last century, from 1740 to 1780. They published works on furniture and designs for other manufacturers, and were noted as well for their taste in design as for their execution.

Gas.—About twelve months ago, Messrs. Nordhoff & Co., of Nismes, patented a gas carburetting apparatus, which soon came into use in several large towns in the south of France. The apparatus has just been patented in England. One has been exhibited at Messrs. Hartwright & Meyerheim's, 19, Chapel-walks, Pall-mall. The apparatus is intended to be placed near the gasmeter, and its adoption, it is said, will not require the least alteration in the gas-fittings. In outward appearance, the apparatus is described as resembling a meter. The internal arrangements consist simply of a cubic network of worsted wicks, reaching with its ends into some carburetted liquid, which is of a constant level. This network is placed in a cylinder of copper or iron, between two sides pierced with small holes. A tube, also perforated, leads the gas through the network of wicks. The instrument varies in size from five lights up to 150 lights.——The following tenders for the erection of the new gasworks at Bedford have been sent in:—

Houghton & Day	£2,950	0	0
Maxey	2,820	19	6
Cunvin	2,745	0	0
Francis & Son	2,269	10	0
Conquest (accepted)	2,190	0	0

The New Covered Market at Derby.—The erection of this market is progressing. The general arrangements on the ground plan show a market hall, measuring externally 223 feet in length by 115 feet in width, and internally 220 feet by 110 feet 6 inches, extending from a point 26 feet south of the back wall of the townhall to the new gateway erected at the end of the new street branching out of Albert-street, opposite Princes-street, which it is proposed to call "Exchange-street;" with a smaller building adjoining for the sale of fish and game, measuring inside 60 feet in length by 38 feet wide, abutting upon the main building at the south-east corner, with a small triangular piece of land reserved for a soup kitchen, occupying for the most part the site of the old lock-up. An approach, about 27 feet in width, will lead from the east end of Albert-street and the Morledge to the south-east entrance of the fish market. The builder's work has been let to Mr. C. Humphreys, for 5,750*l.*; and the ironwork to Mr. J. Haywood, jun., for 4,802*l.*; total, 10,552*l.* The style of architecture adopted is Italian, chiefly executed in brickwork, relieved round the sides and ends by stone string courses, imposts and dressings at the doorways and entrances. The N.N.E. elevation will be in the rear of the townhall. At the opposite end the market will be seen from Albert-street: here the elevation differs, the centre of the façade being wholly of stone-work, terminating with a large pediment, in the tympanum of which there will be carved the Borough Arms.

Oxford Architectural Society.—A meeting of the Oxford Architectural and Historical Society was held in the Taylor Building on Wednesday, the 2nd instant. Subjects:—1. On the Building of the Trinity Aisle, Thame, A.D. 1442, by Mr. E. J. Payne; 2. On some Churches in France, by the Rev. P. G. Medd, M.A., University College.

Fatal Accident to a "Steeple Jack."—A man was suspended 75 feet in the air by a rope thrown over the top of a chimney at Messrs. Kendall Ghent's machine works, Salford. This was to enable him to point some of the masonry or brickwork. The rope broke, and of course the man was killed by the fall.

John Bunyan's Bones.—A public meeting of some hundreds of working men has been held in the Lambeth Baths, Westminster-road, on the rumoured attempt of the Ecclesiastical Commissioners to appropriate Bunhill-fields burial-ground to building purposes. Mr. G. Hill, of the Lambeth vestry, presided, and introduced the business of the meeting by calling upon Mr. G. M. Murphy to deliver a lecture upon the subject. The lecturer traced the history of Bunhill-fields, from the time it became a bone-hill, by the burial there of many who died of the plague in 1665; soon after which it became a Nonconformist burial-ground; and among the buried, as we have before pointed out in the *Builder*, there lie John Owen, George Fox, John Bunyan, Daniel De Foe, Isaac Watts, John Wesley's mother, Dr. Lardner, and many martyrs of political and ecclesiastical tyranny. Mr. Murphy concluded by proposing the following resolution, which was unanimously carried:—"That this meeting, having learned with surprise that it is in contemplation by the Ecclesiastical Commissioners to remove the remains of the honoured dead from Bunhill-fields, and to let the land for building purposes, cannot but express its utmost indignation at such a sacrilegious project, especially as in that renowned place are the mortal remains of the immortal author of the 'Pilgrim's Progress.'"

Opening of a Workpeople's Hall, at Smethwick.—Messrs. Fox & Henderson having given up their well-known works at Smethwick, in 1858, they came into the hands of Messrs. Watkins & Keen, patent nut and bolt makers, who employ about 1,000 men, women, and boys. Having a spare piece of land at one corner of their works, fronting Crawford-street, they employed Mr. J. B. Nicholls, of Smethwich, architect, to furnish plans, and in a short time they had erected a building containing a hall, 90 feet long by 60 feet wide, with a spacious gallery, and which is capable of seating nearly 2,000 persons. At one end of the hall is an orchestra; and there are comfortable seats and desks of stained deal running across the room. One part of the room is partitioned off for a library, and Messrs. Watkins & Keen have already purchased upwards of 2,500 volumes to furnish it. There are large boilers erected in the room for the purpose of making soup and coffee for the workpeople at dinner and tea time. Adjoining the hall is also a good-sized room, which will be fitted up for baths. The building and fixtures have cost upwards of 1,000*l.*, which has of course been defrayed by Messrs. Watkins & Keen, who give the hall, which has just been inaugurated, for the use of their workpeople. If there be any truth in the mobility's axiom, "Handsome is as handsome does," Messrs. Watkins & Keen must be handsome fellows, *et error nullus*.

The Old London Fire Brigade.—The following note of the means used, in the early part of the reign of Richard I., for the purpose of preventing the loss of life and the destruction of property by fire, is interesting; and although we have in the metropolis much to do in this respect in our own times, the contrast between the old and the new is striking. In the first year of Richard I., the articles of the Wardmotes respecting fires are as follows:—"Item, that all persons who dwell in great houses within the ward have a ladder or two ready and prepared to succour their neighbours in case misadventure should occur from fire. Item, that all persons who occupy such houses, have in summer time, and especially between the Feast of Pentecost and the feast of St. Bartholomew (August 24th), before their doors a barrel full of water for quenching such fire, if it be not a house which has a fountain of its own. Item, that the reputable men of the ward, with the aldermen, provide a strong crook of iron, with a wooden handle, together with two chains and two strong cords, and that the bedel have a good horn and loudly sounding. Of persons wandering by night, it is forbidden that any person shall be so dareing as to be found wandering about the streets of the City after the curfew rung out at St. Martin's-le-Grand and St. Laurance, or at Berkyngchirch, upon pain of being arrested."

ENGLISH *v.* SWEDISH IRON.—Experiments of an important nature have just been made at the fortress of Carlberg, in Sweden, upon the respective merits of armour-plate made in England, France, and Sweden. Messrs. John Brown & Co., of Sheffield, sent two plates, one 12 feet by 2 feet 6 inches, and one 6 feet by 3 feet 8 inches. Messrs. Petin, Gaudit, & Co., of Lyons, sent two plates, each of 7 feet 6 inches by 3 feet 3 inches. The Montala Ironworks Company, of Sweden, sent two plates of 12 feet by 2 feet 6 inches, and one 6 feet by 3 feet 8 inches. All the plates were 4½ inches in thickness, and then bolted to a teak target backed with iron plating, and supported by a massive stone pier. The two upper plates in the target were the French, and each was secured by 11 bolts. The next plate below was the longest, Swedish, and this was secured by 29 bolts. Below this was a tier of two short plates, one Swedish and one English, each secured by 24 bolts, and the lowest plate was a long English, secured, like the Swedish, by 29 bolts. Each plate received six shots from the ordinary 68-pounder naval gun. The French and Swedish plates broke to pieces, and the English plates remained uninjured and free from cracks. The shots used were of Swedish iron, and exhibited great toughness as compared with the shots used in the English service—the core or centre of the shot, after striking, being of double the weight of the core of the English shot.—*Army and Navy Gazette.*

TENDERS.

For the erection of new premises for the London and County Bank, Winchester. Mr. Fred. Chancellor, architect:—

VIRTUE, BROTHERS, & CO., 1 Amen Corner.

PARTNERSHIP.—WANTED, a Gentleman, who can command from 500*l.* to 1,000*l.* to join the Advertiser in WORKING an Old-established BRICKFIELD, in a rising town in Hertfordshire.—For particulars, apply to M. A. Post-office, St. Albans, Herts.

A MEMBER of the INSTITUTE, who has been for several years in good practice in ecclesiastical and general architecture, and is possessed of capital, wishes to enter into PARTNERSHIP with, or to take the Business of, a London architect of good position, who is desirous of retiring from the more active duties of the profession. Communications which will be considered strictly confidential), stating real name and full particulars, to be addressed to ARCHITECT, care of Mr. Lock, Newsagent, 220, Gray's-Inn-road, London, W.C.

A LONDON ARCHITECT, in large practice, requires a PARTNER, either a Young Man skilful in his profession, and possessing means sufficient to purchase a share in the business, or one in practice, holding a public appointment, or other equivalent, for the share he would obtain.—Address, with full particulars, to M. I. B. A. Office of "The Builder."

TO PARENTS AND GUARDIANS.

A CIVIL ENGINEER, holding the Office of Engineer, &c. to the Corporation of a large Town in the West of England, has a VACANCY for a PUPIL. Unusual advantages are offered, and a moderate premium is required.—Address, C. E. Office of "The Builder."

GAS and GENERAL ENGINEERING WORKS, 1, HANOVER-STREET, EDINBURGH (opposite the Royal Institution of Arts). Mr. JOHN ROMANS, Practical and Civil Engineer, may be consulted at the above address on all matters pertaining to gas-works, water-works, and other engineering questions.—Plant and specifications furnished, executed and repaired, or taken on lease for a term of years.—Orders received for Scottish Cannel Coal and Fire-clay goods.

BIRKENHEAD.—To SURVEYORS and CIVIL ENGINEERS.—The Birkenhead Improvement Commissioners invite APPLICATIONS from properly qualified persons for the OFFICE of SURVEYOR to the BOARD, the salary for which has been fixed at 500*l.* per annum, the necessary Assistants and Offices being provided by the Board. A thorough practical knowledge of drainage, sewerage, road-making, laying out of streets, surveying, regulating of buildings, assessing, and the various other details involved in an efficient carrying out of the general works of the town, is indispensable. The person appointed will be required to devote the whole of his time to the duties of the office, and is precluded from undertaking any other employment whatever. The duties to commence on the 1st FEBRUARY next, and the engagement is subject to termination by either side on six months' notice.—Applications and testimonials under cover, endorsed "Surveyorship," and addressed "To the Chairman of the Road and Improvement Committee, Commissioners' Offices, Birkenhead," to be sent in on or before the 16th DECEMBER next.—By order,

AMBROSE WALN, Clerk of the Birkenhead Improvement Commissioners.

Commissioners' Offices, Birkenhead, 24th Nov. 1863.

CITY of ELY BOARD of HEALTH.—The Local Board of Health give Notice that at their Meeting to be held on WEDNESDAY, the 30th day of DECEMBER instant, at the Grand Jury Room in the Shire Hall, Ely, at TWELVE o'clock at noon, they will be prepared to appoint a duly proper person to the united offices (become vacant by the resignation of Mr B. Latham on his appointment to the Surveyorship of the Croydon Local Board) of SURVEYOR, INSPECTOR OF NUISANCES, and SUPERINTENDENT OF HIGHWAYS for the District of the City of Ely, which comprises an area of about 17,000 acres, contains 1,600 Houses, and 145 miles of Highways, under the jurisdiction of the Local Board. The person elected will be required to devote the whole of his time to the duties of the offices, and to give security for the performance, himself in 500*l.*, and two sureties in 100*l.* each. Candidates may collect the duties appertaining to the several offices from the "Public Health Act, 1848," the "General Highway Act," the "Nuisances Removal Act, 1855," the "Local Government Act, 1858," and the several Acts incorporated therewith; but it is indispensable they should be persons familiar with the construction and working of steam engines, furnaces for the consumption of smoke, filters, works of water supply, sewerage through tubular pipes, and house drainage; the making and management of roads, streets, and pavements, the taking of levels, the value of labour and materials, the preparation of plans, specifications, and estimates, and the superintendence and management of all such works as come within the province of a Local Board of Health. The salary will be 120*l.* a year, payable quarterly. The elected Officers will be required to enter upon his duties as soon after the 6th of January next as possible, and his tenure of the offices will be during the pleasure of the Local Board. Applicants must forward their testimonials to me on or before TUESDAY, the 15th instant, accompanied by a letter in their own handwriting, stating their present or latest employment, and containing the names and addresses of their proposed sureties; on receipt of which a selection will be made, and such candidates only as shall receive an invitation from the Clerk will be expected to attend on the day of election. The Board do not pledge themselves to appoint any of the candidates.—By order of the Board,

WILLIAM MARSHALL, Clerk.

Ely, December 2nd, 1863.

CANTERBURY PAVEMENT.—Notice is hereby given, that at the next Meeting of the Commissioners of the Canterbury Pavement, which will be held at the Guildhall, in the said City of Canterbury, on WEDNESDAY, the 13th day of JANUARY next, at TEN o'clock in the forenoon, the said Commissioners will APPOINT a HARD-STONE MASON, to act as Warning Foreman, under the Commissioners. He must have been well experienced in paving, be qualified to keep accounts, and will be required to devote the whole of his time to the works the Commissioners may from time to time have in hand. CANDIDATES for the APPOINTMENT must make APPLICATION, in writing, to the Clerks, at their Office, Watling street, Canterbury, on or before the 12th day of JANUARY next, at which time they are to be accompanied with testimonials as to sobriety and character. Salary, 50*l.* per annum.—By order of the Commissioners

WISHTWICKE & KINGSFORD, Clerks

Canterbury, 10th December, 1863.

THE OSWALDTWISTLE LOCAL BOARD.—SURVEYOR and INSPECTOR of NUISANCES.—The Local Board for the District of Oswaldtwistle, in the County of Lancaster, requires the services of a properly qualified Person to perform the duties of SURVEYOR and INSPECTOR of NUISANCES. He will be required to reside within the District, and to devote the whole of his time to the duties of the Offices. Salary 80*l.* per annum. Applications, with Testimonials, to be sent on or before the 31st day of DECEMBER, 1863, to the Local Board Offices, Oswaldtwistle, near Accrington, Lancashire, addressed to "The Chairman of the Highway and Drainage Committee."

JOHN PICKUP, Law Clerk.

TO PLUMBERS AND BUILDERS

WANTED, by an experienced PLUMBER a JOB or a SITUATION. He understands his business in all its branches. Has no objection to fill up his time with glazing or plain painting. In or near London. References if required.—Address, C. D. Mr. Berry's, 13, St. John's-square, E.C.

WANTED, by the Advertiser, a RE-ENGAGEMENT as CLERK of WORKS. Good references from last engagement.—Address, F. B. Post-office, Brompton-row.

TO NOBLEMEN, GENTLEMEN, AND OTHERS.

WANTED, by the Advertiser, a SITUATION as General CLERK of WORKS or MANAGER of an ESTATE. Is a thoroughly practical man of good address, long experience, and has seen rough knowledge of the building trade in all its branches, drainage, &c. Has had charge of extensive works in various parts of England, Wales, and France, and was three years in the East Indies. References of the highest respectability can be given.—Address, W. H. W. J. No. 8, Upper York-place, St. John's-wood.

TO ARCHITECTS AND BUILDERS

WANTED, an ENGAGEMENT, by the Advertiser, who can prepare Drawings and Specifications, take out Quantities, Estimate, and keep Builders' Accounts. Terms, 30*s.* per week. Good references.—Address, A. C. Z. Mr. Millson's, Post-office, Caledonian-road, N.

WANTED, by the Advertiser, a Carpenter, a RE-ENGAGEMENT as GENERAL FOREMAN. First-class references.—Address, L. M. 16, Calvert-street, Shoreditch.

WANTED, by an active Young Man, a SITUATION, as SALESMAN, in a Retail Timber, Deal, and Mahogany Yard, or FOREMAN in a Builder's Yard. Has had good experience, and competent to fill either situation. Can give references as to honesty and ability.—Address, A. B. 16, Devonshire place, Edgware-road, London, N.W.

TO CIVIL ENGINEERS, SURVEYORS, &c.

WANTED, a SITUATION, by the Advertiser, who will shortly leave the office of an Engineer. He is a neat draughtsman and colourist. Salary not so much an object as a desire to improve.—Address, J. G. Office of "The Builder."

TO SURVEYORS, BUILDERS, &c.

WANTED, EMPLOYMENT, for a short time, by a thoroughly competent Young Man, to prepare drawings and estimates, take out quantities, measure up work, or to square up accounts.—For particulars, apply to G. D. C. 340, Oxford-street, W.

TO ARCHITECTS, SURVEYORS, AND BUILDERS

WANTED, by the Advertiser, TEMPORARY EMPLOYMENT, at his home. Is a most careful and expeditious copyist, and good draughtsman generally; very quick at accounts, &c. Terms moderate.—Address, A. Z. Post office, Vere street, W.

TO BUILDERS, ARCHITECTS, AND OTHERS.

WANTED, by a very experienced trustworthy Man, a SITUATION, as GENERAL FOREMAN, or CLERK of WORKS. First class testimonials. Aged 39.—Address, A. B. 321, City-road, E.C.

TO BUILDERS AND SURVEYORS.

THE Advertiser requires an ENGAGEMENT in either of the above offices. Thoroughly understands abstracting, bulling, measuring up, and taking off quantities. Age 23.—Address, D. E. at Gravatt's, King-street, Cheapside, E.C.

TO ARCHITECTS

THE Advertiser, who has had considerable experience in designing, preparing perspective, competition, and office drawings, a good draughtsman, and fair colourist, is desirous of an ENGAGEMENT in Town.—Address, R. V. 2, Vincent-street, Brompton S.W.

TIMBER TRADE.—The Advertiser, who has been brought up to the above business, desires an ENGAGEMENT as SALESMAN or TRAVELLER, or in any situation where a thorough knowledge of the trade would be an advantage.—Address, T. T. care of Mr. Manning, 10, Claremont-place, Horsey-road, N.

TO BUILDERS AND CONTRACTORS.

THE Advertiser, aged 35, is desirous of an ENGAGEMENT, either in Counting-house, as Clerk and Bookkeeper, or to Take Charge of a Job out of doors. Country not objected to. Terms moderate.—Address, Y. R. Jenkinson's Library, No. 120, Upper-street, Islington.

TO ARCHITECTS.

THE Advertiser is open to a permanent ENGAGEMENT in a good office, as JUNIOR. Would be willing to make himself generally useful. Has served two engagements since the expiration of his articles. Good references. Salary moderate.—Address, T. B. 12, Wyvil-terrace, South Lambeth-road.

TO ARCHITECTS AND SURVEYORS.

THE Advertiser is desirous of an ENGAGEMENT as GENERAL ASSISTANT. Is conversant with levelling and surveying; can colour, and finish plans and drawings neatly. First-class references given.—Address, KENT, 1, Palmerston street, Battersea-park, South Lambeth.

TO DRAINAGE AND RAILWAY ENGINEERS AND CONTRACTORS

THE Advertiser, having many years' experience as Overlooker on Railways, and having just completed a large "Outfall Drainage Contract" for the General Land Drainage Improvement Company, is DISENGAGED, and desires RE-ENGAGEMENT. First-class testimonials. Refer to J. Bailey Denton, Esq. 62, Parliament-street, Westminster.—Please address, M. M. 17, Albert-street, Shrewsbury. No objection to go abroad.

TO ARCHITECTS AND OTHERS.

THE MANAGING CLERK to a well-known Gothic architect is desirous of EVENING EMPLOYMENT, by Architects or others. Would work at Architects' Offices if desired. Can work in to rough sketches, outline perspectives, rough, and write specifications.—Address, E. Boddington's Library, Nottinghill Gate, London, W.

DOUCEUR.—An Ex-Engineering Scholar and Fireman of the Queen's University in Ireland will give a liberal DOUCEUR for an APPOINTMENT as ASSISTANT ENGINEER on a RAILWAY, or Assistant to a Town or Country Surveyor. No Agents.—Address, CIVIL ENGINEER, 21, Liverpool street, King's Cross.

TO INVENTORS.—All intending Patentees should procure the PRINTED INFORMATION regarding PATENTS—their cost, and mode of procedure to be adopted—issued gratis by the General Patent Company (Limited), 71, Fleet-street, London. ROBERT M. LATHAM, Secretary.

W. HOLMES, LITHOGRAPHER, No. 36, BASINGHALL STREET, E.C. Maps, Plans, Quantities, &c.

POLYTECHNIC.—Patron: H.R.H. the PRINCE of WALES.—Professor Pepper's adaptation of the original and most startling Ghost Illusions of H. Dircks, esq., C.E., in Six Scenes First Scene—Reading Room Scene—"Haunted Man," and appearance of the Ghost and Spectre of the sister. Second Scene—The Artist's Studio—the ghostly visitor in the form of a rival artist—the Ghost drinking a glass of water; (this illusion must be seen to be believed) the living being enveloped by the Spectre. Third Scene The reading of the love-letter, and mysterious arrival of the little postman "Cupid" Engagement of Mdlle. Cornalba, for her new Vocal Organophonic, and Ventriloquial Entertainment. Herr Smith's remarkable imitations of birds and animals. In consequence of numerous inquiries the opera of "Der Freischutz" is reproduced. Open Twelve to Five and Seven to Ten o'clock.

INTERNATIONAL EXHIBITION, 1862.—CLASS 13. Only Medal awarded for "excellence of construction of Mathematical Instruments."

OCTAVIUS N. SIMPSON, STAMFORD;
and see Specimens at the Office of
Messrs. PINDER SIMPSON & SONS, 29, Savile-row, London, and at the Museum of Practical Geology, Jermyn-street, W.
This stone (which is a perfect colite), is raised in blocks of any portable size, and is about four feet thick in the bed. It will stand ANY WEATHER, is much used for water-works, and for the building and restoration of churches. When used as ashlar work it is not necessary to place it bed-wise. It works freely with a hook-saw, and is wrought at a cheaper rate than any stone in the kingdom.

W. HOLLAND, Pavior, Mason, and Road Contractor,
Aberdeen, Guernsey, Mount Sorrel, and Haytor Granite Depôt.
Paving Works done in town or country

At 6d. 7d. and 8d. per foot, at
JOHN COUMBE'S,
LADY LAKE'S GROVE, MILE-END GATE.

VENTILATION—PURE AIR.

THROUGH THE EXTERNAL WALL.
These Ventilators are arranged so that the requisite quantity of air may be admitted for the due ventilation of an apartment without the slightest draught being felt by the occupants; and as they are placed in the external wall, their action is not impeded when the house is closed for the evening, at which time a constant supply of fresh air is most required.—HAYWARD, BROTHERS, sole Manufacturers, 187 and 189 (late 117 and 118), Union-street Borough, London

GUTTA-PERCHA MILL-BANDS.—The Gutta-Percha Company beg to state that the increasing demand for the Gutta-Percha Strapping for Driving-bands, Lathestraps, &c. fully justifies the strong recommendations they have everywhere received. Their durability and strength, permanent contractability and uniformity of substance; their non-susceptibility of injury from contact with oils, grease, acids, alkalies, or water; and the facility with which the only joint required can be made in bands of from 200 to 300 feet long, render them superior to leather for almost all working purposes, and decidedly more economical. Every variety of Gutta-Percha Articles, such as Tubing, Soles, Pump-buckets, Fire-buckets, Bosses, Union-joints, Flasks, Bottles, Bowls, Toilet-trays, Curtain-rings, Galvanic Batteries, Tallotype Trays, &c. &c. manufactured by the Gutta-Percha Company, and sold by their Wholesale Dealers in town and country.
THE GUTTA-PERCHA COMPANY, PATENTEES,
18, WHARF ROAD, CITY ROAD, LONDON.

"H. Doulton & Co.—Stoneware Pipes, &c. excellence of manufacture and lowness of price."

GLAZED STONEWARE DRAIN PIPES, TERRA-COTTA CHIMNEY TOPS, &c. &c.

Supplied on the lowest terms, direct from

H. D. & CO.'S MANUFACTORIES, HIGH-STREET, LAMBETH, LONDON; ROWLEY REGIS, STAFFORDSHIRE; and SMETHWICK, near BIRMINGHAM.

3s. 9d.

INTERNATIONAL EXHIBITION, 1862.

CLASS 35, NO. 6849.

The only Medal "for Stone Ware" has been awarded to

DOULTON & WATTS, LAMBETH POTTERY,

LONDON.

In expectation of a greatly increased sale, D. & W. have determined to introduce the annexed pattern of their ENAMELLED STONEWARE CLOSET PANS, at the price of the commonest description of earthenware.

Experience has shown that this shape is the most simple and efficient, and that in strength, durability, and cleanliness it cannot be surpassed by the most expensive closets.

FIGURE D STONEWARE CLOSET PAN AND TRAP, 3s. 9d. COMPLETE.

JAMES STIFF & SONS,

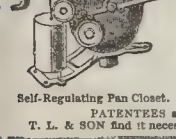
MANUFACTURERS OF GLAZED STONEWARE DRAIN-PIPES, WATER-CLOSET PANS, SINK-TRAPS, INVERT BLOCKS, AND ALL OTHER ARTICLES SUITABLE FOR DRAINAGE PURPOSES; ALSO

IMPERISHABLE TERRA-COTTA CHIMNEY-TOPS, FLUE-PIPES, COPINGS, GARDEN EDGINGS, &c.

LONDON POTTERY, HIGH-STREET, LAMBETH, LONDON.

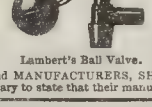
STRAIGHT TUBES, with SOCKET JOINTS, in Two-feet Lengths.

PAN, 4s. 6d.

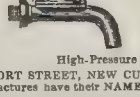


TRAP, 2s.

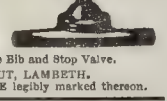
HALF-SOCKET PIPES same prices as the Whole Sockets, by the use of which Drains may be readily examined, and Junctions inserted, in the event of requiring further connections.



Manufactures also of



LOVEGROVE'S PATENT DOUBLE AND TRIPLE JUNCTIONS AND INSPECTION SHAFTS for small Sewers and Drains, by the use of which the Sewers and Drains may be examined and cleansed without disturbing the surface of the ground; adapted also for ventilation of Sewers and Drains.



DRAWINGS, WITH PRICES, WILL BE FORWARDED FREE, ON APPLICATION.

THOMAS LAMBERT & SON,

Self-Regulating Pan Closet. Lambert's Ball Valve. High-Pressure Bib and Stop Valve.

PATENTEES and MANUFACTURERS, SHORT STREET, NEW CUT, LAMBETH.

T. L. & SON find it necessary to state that their manufactures have their NAME legibly marked thereon.

BARTLETT, BROTHERS, & CO.

PATENT INDURATING SOLUTIONS AND SILICEOUS PAINT.

DEVONSHIRE WHARF, CAMDEN TOWN, N.W.

THE FLUO-SILICIC STONE-PRESERVING COMPANY, LIMITED.

39, CHARING CROSS, S.W. & 12, COPTHALL COURT, THROGMORTON STREET, E.C.

PATENT FLUO-SILICIC INDURATIONS for the PRESERVATION of STONE, CEMENT, and other like materials. The Company apply to the surface of Stone, Cement, &c. a solution of Fluo-Silicic Acid, and Silicate of Potash. These are the only patents which embrace the use of that most valuable agent, Fluo-Silicic Acid. Bath, Caen, and other soft stones, when treated by the Company's solution, become extremely hard. The great expense of high ornamental to buildings in hard stone has been an obstruction to Art, but since the Fluo-Silicic process can be applied so readily to soft stone after it is carved, that obstruction exists no longer. The Fluo-Silicic at once permanently arrests the decay of all stone.—For further information apply to the Manager of the Company, Mr. DUDLEY, Architect, as above.

HUBBUCK'S PATENT WHITE ZINC PAINT.

By their process, which is patented, pure Zinc Paint is Cheaper than White Lead. It does not change colour with the London Atmosphere

ADULTERATIONS—Some Paint Grinders have been selling Zinc Paint adulterated with Sulphate of Baryte from ten to thirty per cent Whether sold under the name of "Improved Zinc Paint," or as the number Two or Three quantities, no workman can produce good work with such material Workmen who have once used the Patent Zinc Paint will never willingly use any other Paint for their best work

CHEAPNESS. Not only is it cheaper per hundred weight, but two hundred weight of this Paint, with six gallons of oil covers as much surface as three hundred weight of white lead and twelve gallons of oil.

EACH CASK IS STAMPED "HUBBUCK, LONDON, PATENT."

THOMAS HUBBUCK & SON,

WHITE LEAD, OIL, PAINT, AND VARNISH WORKS, 24, LIME STREET, LONDON.

CHEAP, LIGHT, AND DURABLE ROOFING.

CROGGON'S PATENT ASPHALTE ROOFING FELT has been extensively used and pronounced efficient, and particularly applicable for warm climates.

1st. It is a non-conductor.—2nd. It is portable, being packed in rolls, and not liable to damage in carriage.—3rd. It effects a saving of half the timber usually required.—4th. It can be easily applied by any unpractised person.—5th. From its lightness, weighing only about 42 lbs. to the square of 100 feet, the cost of carriage is small.—6th. Under slate, metal, or tiles, it is a most effective non-conductor

INODOROUS FELT, for damp walls and for damp floors, under carpets and floor cloths. Price ONE PENNY per Square Foot.

CROGGON and CO.'S PATENT FELTED SHEATHING, for Covering Ships' Bottoms, &c. and

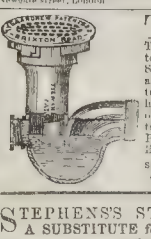
DRY HAIR FELT, for Covering Steam Boilers, Pipes, &c. preventing the radiation of Heat, saving 25 per cent. of Fuel, and deadening Sound.

Samples, testimonials, and full instructions, on application to

CROGGON and CO. 2, DOWGATE-HILL, London; and 2, GOREE PIAZZA, Liverpool.

J. TYLOR & SONS' PATENT

REGULATOR WATER-CLOSETS.



Valve.

Pan.

The Regulator Valve gives perfect control over the supply of water to each closet, so that, however small the fall of water, perfect flushing is insured. Any number can be worked by one supply pipe. No intern valves, cranks, or wires required. The Closets can be seen in action at the Manufactory, and Illustrated Catalogues had on application to the Manufacturers, J. TYLOR & SONS, Warwick-lane, Newgate street, London

---

TYE & ANDREWS NEW PATENT SINK TRAP is universally admitted to be the only perfect Trap for Sinks in Domestic Dwellings, as fixed at the principal Institutions. Among others, Wellington Barracks, Royal College of Surgeons, &c. &c. Prospectuses on application to the Patentees, TYE & ANDREW, Brixton-road.

SUPPLIED BY ALL LEAD MERCHANTS AND IRONMONGERS.

STEPHENS'S STAINS for WOOD. A SUBSTITUTE for PAINT, and at HALF the COST.

Mr. STEPHENS has been kindly permitted to make public the following extract from a letter addressed to him by the Rev. R. H. CHICHESTER, of Cuttiscumbe, near South Molton:—

"The effect produced by the Stains and Final and Varnish has given such entire satisfaction, that the parishioners have requested me to procure five times the quantity now paid for, in order to finish the church."

H. STEPHENS, Chemist, 18, St. Martin's-le-Grand, E.C. late of 5a, Stamford-street, S.

FULLER & HORSEY, 13, Billiter-street, London, E.C.

NORTH LONDON RAILWAY.

MESSRS. KENNEDY & BONNY will SELL by AUCTION, on the 8th, 9th, 15th, 16th, and 18th of JANUARY, 1864, at the SPREAD EAGLE TAVERN, Kingsland road, the valuable MATERIALS of about Ninety Houses, Shops, Factories, Taverns, and other Buildings, required for the City Extension between Old-street-road and Worship-street.

Camden Town, December 10 1863.

THE OLD FAMILY MANSION, FORSTON HOUSE, with its additions, lately occupied as the Pauper Lunatic Asylum of the county of Dorset, for SALE.—Early in next year will be offered for SALE by PUBLIC AUCTION, at Dorchester, the whole of those Premises, consisting of the above mansion, with buildings erected for the accommodation of 150 patients, and suitable domestic offices, airing yards, stabling, and farm buildings. The site, which, together with gardens and paddocks, contains about nine acres, is all walled in. The place is situated about four miles from Dorchester, and is bounded on the western side by the turnpike road leading from that town to Corve Abbas, and on the north and east by lands belonging to R. B. Sheridan, Esq. M.P. and on the south by the property of Henry Charles Sturt, Esq.

A small river runs through the length of the property between the Turnpike-road and the Gardens, and the water required for the Establishment has been pumped up by a water-wheel, and there are two steam boilers for supplying the apartments with hot water. There is a Lodge Cottage at the entrance. The Mansion, which has been occupied by the Superintendent, is situated at the south end of the premises, and has at different times been the residence of some of the county families.—The place may be seen on application by letter, addressed to J. G. SYMES, Esquire, Medical Superintendent; and further particulars may be had by applying to Mr G. EVANS, the County Surveyor, at Wimborne, Dorset.

REPOSITORY, BARBICAN.—FRIDAY'S SALE.—First class Railway Horses, TO BE SOLD by AUCTION, by

MR. GOWER, on FRIDAY, DECEMBER the 18th, 1863, at TWELVE o'clock, Twenty-five Young Powerful Active CART or VAN HORSES, among which are some excellent Yeomen's Cobs, Chaise Teams, and Pairs for van work, by direction of Mr. John Knight, second Portion, off the Marlborough Branch of the Great Western Railway, nearly completed. The above Horses are working under the notice of Contractors, Builders, Wharfingers, and Others, having been purchased regardless of cost, are in excellent condition, and for unreserved sale. On view two days prior.

FREEHOLD BUILDING LAND TO BE SOLD, or LET on LEASE. This desirable piece of Building Land is situated in Bromley, Kent.—For particulars apply to J. LAVENDER, Esq. Surveyor, 2, Bedford-row.

SYDENHAM HILL.—LAND TO BE LET, for Building, 430 feet frontage, average 500 feet deep. Beautiful site, with extensive prospects, and fronting a high road. Close to three railway stations, and within ten minutes' walk of the Crystal Palace. May be had in one, two, or three plots, for detached residences.—For particulars, apply, personally, to Mr. HENRY DAWSON, Architect, 16, Finsbury-place South, E.C.

A LARGE BUILDING, accommodating 1,000 persons, for SALE Now used as Holy Trinity Free Church, Hackney. Has Pulpit, Reading Desks, Gas-fittings, Warming Apparatus, &c. Admirably constructed for seeing and hearing.—Address, "ZETA," 2, King Edward's-road, N.E.

PENGE.—FREEHOLD LAND TO BE LET, on Building Lease, nearly opposite the church and Watermans's Almshouses. Contents, 4½ acres.—Apply to Mr. JOHN WEAK, 225, Camberwell-road, S.

TO BRICKMAKERS and CONTRACTORS.—TO BE DISPOSED OF, by PRIVATE TREATY, the BRICKFIELDS of the late Mr. William Davis, situate at Little Thurrock, Grays, Essex, a short distance from the river Thames and Railway station. The field is in capital working order, and the plant capable for working seven stools, with horses, carts, and implements, and are adapted for carrying on an extensive and profitable business. The stock of bricks remaining on the field may be taken if required, and early possession had.—For particulars apply to Mr. GRIGG (successor to the late Mr. Barnes), Auctioneer and Estate Agent, 78, King William-street, Mansion House, E.C.

WANTED to RENT, PREMISES, containing an area, collectively, of about 20,000 feet One building, containing the above accommodation in different floors, would be preferred; but the parties would be prepared to treat for a block of several houses.—Address, with full particulars, to Messrs. JENNINGS & SON, Solicitors, 18, Bennett's-hill, Doctors' Commons, E.C.

SITE for a PUBLIC INSTITUTION.—It being under consideration, by one of the Orphan Asylums, whether it may not be advisable to REMOVE the Institution from the Metropolis to the Suburbs, provided a Site of Ground for the purpose can be obtained on advantageous terms, all persons disposed to GIVE or SELL a SITE of LAND, of not less than seven acres, within about twenty miles of London, near a railway station, are invited to communicate, on or before the 28th day of DECEMBER instant, stating full particulars, with GEORGE BOOTH, Esq. Solicitor, No. 6, Surrey-street, Strand, W.C.

TO BUILDERS or TIMBER DEALERS. TO BE LET, with immediate possession, a DETACHED DWELLING-HOUSE, with good Business Premises; capital Carpenter's Workshop, with Cottage adjoining for Man. The house contains six rooms and offices, a large garden well stocked, three-stall stable, cart house, &c. &c. It is situate thirteen miles north from London, and within half a mile of the Great Northern Railway.—For further particulars inquire of E. B. care of Mr. Paterson, Builder, Hadley-green, near Barnet, N.

TO BE LET, for the Erection of Warehouses, a PLOT of FREEHOLD LAND, in Park-street, Southwark, about 74 feet frontage.—Apply to Mr. W. F. MEAKIN, No. 4, Martin's-lane, Cannon-street, E.C.

HAMPTON, MIDDLESEX, on the Banks of the Thames, and close to the intended Thames Valley Railway Station.—TO BE SOLD, or LET, on Building Leases, Eligible BUILDING LAND.—For particulars, apply to J. WHEATLEY, House and Estate Agent, East Moulsey.

TO BRICKMAKERS.—10 acres of LAND TO BE LET, for the above purpose, near the Barking-road Station and Victoria Docks.—Address, E. L. 40, Norfolk-street, Strand.

PANGBORNE, BERKS.—Valuable Freehold Land, within five minutes' walk of the most beautiful part of the river Thames and of the railway station, and about one hour's journey from London. TO BE LET, in large or small lots, about 200 ACRES of LAND, admirably adapted for gentlemen's residences and villas, delightfully situated, with fine views of the country and river Thames.—Apply to W. E. RATCLIFFE, Esq. Solicitor, Ryde, Isle of Wight; or to F. NEWMAN, Esq. Surveyor and Architect, Ryde, Isle of Wight.

WANTED, a FREEHOLD or very long LEASEHOLD HOUSE or PREMISES, from 40 to 50 feet frontage by 100 feet in depth, with early possession, in any of the large thoroughfares. The Strand, Fleet-street, or Ludgate-hill preferred, or a vacant site would be purchased.—Full particulars to be sent to Messrs. DRIVER & CO. Surveyors, Land Agents, and Auctioneers, 4, Whitehall, London, S.W.

A WHARF TO LET, in a convenient situation.—Apply by letter to Mr. GRUGEON, 75, Old Broad-street, E.C. City.

VAUXHALL GARDENS ESTATE.—Several very valuable SITES on the above Freehold Estate, TO BE LET, for Building purposes.—Apply to Messrs. DRIVER & CO. Surveyors, Land Agents, and Auctioneers, 4, Whitehall, S.W.

KEYNSHAM BLUE LIAS LIME and CEMENT WORKS, Somerset.—TO BE SOLD, by PRIVATE CONTRACT, by order of the Liquidator, the newly-formed FREEHOLD WORKS, occupying a site of 7 acres, 2 roods, and 36 perches, or thereabouts. The existing kilns and ovens are capable of producing 700 to 800 tons of lime, and 150 tons of cement weekly, both produce being approved of by large contractors and eminent architects, the cement being used in many of the Government fortifications now in progress. The buildings are very substantial and the machinery is of the best description, driven principally by water-power, but with steam-power as auxiliary. Coals are supplied to the works at a very low price, and the Great Western Railway Station is within a short distance.—For further particulars, apply to Messrs. W. LINDO & SONS, Solicitors, 47a, Moorgate-street; to F. MAYNARD, Esq. Liquidator, 19, Bread-street, Cheapside; and to Messrs. FULLER & HORSEY, 13, Billiter-street, London.

FREEHOLD MILLS, with good Water-power, Keynsham, Somerset, well adapted for Corn Mills, Oil Mills, or Paper Mills, TO BE SOLD. Apply to Messrs. FULLER & HORSEY, Billiter street, London, E.C.

EXTENSIVE MANUFACTURING PREMISES, with STEAM POWER.—TO BE LET, one of the finest BUSINESS PREMISES in the City; containing large yard, with drying shed, piling stage, extensive Workshops, fitted up with circular saws, mortise and tenoning machines for making doors, and three vertical saw frames for cutting deal planks, &c. 26 inches deep; two powerful steam engines, with hot water tank; a well of good water, self-acting benches, &c. &c. Together with every convenience for a large trade: public and private offices, fitted with fire-proof safes, &c. For further particulars apply at the City Timber Yard, 20, Long lane, City.

MID-KENT LINE.—Eligible Freehold BUILDING LAND TO BE LET, on LEASE for 99 years, direct from freeholders. It is situate on the side of a hill, commanding beautiful scenery, about ten minutes' walk from the Catford Bridge Station, Mid-Kent Railway. Railway journey, 20 minutes. Land may be seen, and particulars obtained, by applying on the spot to FREDERICK SELBY, Ravensbourne Park, Lewisham, S.E.

TO BE SOLD, at a Bargain, several FOUR-ROOMED COTTAGES in CARCASE.—Apply to Mr. R. RICHARDS, on the Premises, Alpha-place, North Cambridge-road, near the Gate, Kilburn.

TO BUILDERS, CONTRACTORS, &c.—TO BE SOLD, a large quantity of BUILDERS' SCAFFOLD POLES, from 22 to 45 feet long, laying on a piece of land opposite the Blue Anchor public-house, Dock-street, near the principal entrance of the London Docks. To be sold cheap, as the land must be cleared by December 31st, 1863.—For particulars, apply on the Premises, from Ten to Four o'clock each day.

TO BRICKMAKERS.—All Parties who BURN BRICKS in CLAMPS are invited to inspect the NEW MODE of SETTING, patented by Mr ROBERT WHITE, and which may be seen in operation at the Brickfields of

J. B. WHITE & BROTHERS, Erith, Kent.

The advantages of this plan are two fold.

1st. Nearly all the bricks are burnt into stocks, and the yield of inferior bricks is reduced from 35 to about 10 per cent of the total make, which in itself represents a large permanent saving.

2nd. The bricks are so much improved in colour and soundness as to give them a considerable additional value in the market over common stocks.

Licenses for use of the Patent granted to Brickmakers, on application to the Patentees, 17, Millbank-street, Westminster.

BURHAM BRICK, LIME, and CEMENT COMPANY, BURHAM WHARF, BELVIDERE-ROAD, LAMBETH.—The public are informed that the Company have taken the above Premises, and have ON SALE, GAULT BRICKS, TILES, POTTERY, DRAIN-PIPES, GREY STONE LIME, PORTLAND and other CEMENTS, and BUILDING MATERIALS of all descriptions. Architects and Builders are respectfully informed that goods of any pattern or design can be manufactured at the Company's Works, erected on the banks of the Medway by the late Thomas Cubitt. They would also call the attention of the public to the very superior quality of their Portland Cement.

SPRING GROVE BRICKFIELDS, HOUNSLOW, W. MIDDLESEX.—Mrs. ANN ELIZABETH BURCHETT begs to thank her numerous friends for the patronage received during the last twenty-five years, and having DISSOLVED PARTNERSHIP with her son, Mr. JAMES BURCHETT, has again OPENED the above BRICKFIELDS on her own account, where by strict attention to all orders she trusts to receive the same encouragement hitherto so liberally bestowed upon her. Office—Cranwell Cottage, Hounslow-road, Hounslow, W.

NOTICE.

BROWN & GREEN'S KITCHEN RANGE WAREHOUSE is now REMOVED to the NEW PREMISES, 72—74, Bishopsgate-street Within, a few doors from the late Address, at No. 81. These afford accommodation for a still larger stock of their Patent Prize Medal Ranges and Stoves, Register Grates, and Cooking Utensils, to meet the great public demand; and also for the consequent more extensive execution, by the manufacturers themselves, of all descriptions of hot water, bath, laundry, and stove work.

72—74, Bishopsgate street Within, November, 1863.

BILLING'S PATENTS.—CHIMNEY TERMINALS.—THROAT VALVES.—NOTICE to ARCHITECTS.—The Proprietors of these PATENTS have given the Widow an Interest in the same, and have considerably reduced the prices of the Articles, trusting that by so doing these useful Inventions may be introduced more generally in all new buildings.—For prices, apply to the Manager, Mr. TYLER, 12, Abingdon street, Westminster, who will also afford any information, he having been for many years engaged with the late Mr. BILLING, in the practical curing of Smoky Chimneys.

THE ARCHITECTURAL MUSEUM, SOUTH KENSINGTON MUSEUM, W.
PRIZES FOR COLOURED DECORATION.

5*l.* 5*s.* and 3*l.* 3*s.* are now offered. The Competition will be open till MARCH 1st, 1864. Casts for colouration, price 5*s.* and full particulars may be had by letter to the Honorary Secretary, at 13, Stratford-place, W.

A. J. B. BERESFORD HOPE, President.
GEO. GILBERT SCOTT, Treasurer.
JOSEPH CLARKE, Hon. Sec.

All requests for Casts for Colouration must be accompanied by a Post-office Order on Charing-cross for 5*s.*; or if case and packing required, 7*s.*

PURSUANT to an Order of the High Court of Chancery, made in a cause "WILLIAM ROWE against EDWIN TIMPSON and Others," the Creditors of Mortimore Timpson, formerly of Stanhope place, Hampstead road, Middlesex, Builder, but late of the Victoria Tavern, Number 8, Crescent place, Mornington-road, Middlesex, Licensed Victualler (who died on the 21st day of August, 1863), and also the Incumbrancers upon his Real and Leasehold Estates, are by their Solicitors, on or before the 21st day of JANUARY, 1864, to come in and prove their claims at the Chambers of the Vice-Chancellor Sir John Stuart, Number 12, Old Buildings, Lincoln's-inn, Middlesex, or in default thereof they will be peremptorily excluded from the benefit of the said Order. WEDNESDAY, the 27th day of JANUARY, 1864 at ONE o'clock in the After noon, at the said Chambers, is appointed for hearing and adjudicating upon the claims.—Dated this 9th day of December, 1863.

ROBT. W. PEAKE, Chief Clerk.
JOHNSON & MASTER,
22, Duke-street, Grosvenor-square, Solicitors for the Plaintiff.

PURSUANT to an Order of the High Court of Chancery, made in a Cause wherein EGERTON PIERS ALLEYN LEIGH, GEORGE BURY WESTBROOK and AUGUSTA SUSANNAH EGERTON his Wife, ADA EGERTON LEIGH and WALTER EDWARD EGERTON LEIGH, ALICE EGERTON LEIGH and LAURETTE EGERTON LEIGH, three Infants, by the said Egerton Piers Alleyn Leigh, their next friend, Plaintiffs, against EUGENIUS BIRCH and JANE ISABELLA CRIER, Defendants, the Creditors of JOHN BRANNIS BIRCH, late of No. 43, Parliament-street, in the City of Westminster, Civil Engineer, who died on or about the 17th day of June, 1862, are by their Solicitors, on or before the 9th day of JANUARY, 1864, to come in and prove their debts at the Chambers of the Master of the Rolls, in the Rolls yard, Chancery-lane, Middlesex, or in default thereof they will be peremptorily excluded from the benefit of the said Order. FRIDAY, the 8th day of JANUARY, 1864 at TWELVE o'clock at noon, at the said Chambers, is appointed for hearing and adjudicating upon the Claims.—Dated this 9th day of December, 1863. GEO. RUDD, Clerk of Court.

WILLIAM MILLMAN, 1, Dane's-inn, Strand,
Solicitor to the above-named Plaintiffs.

BOROUGH of BIRMINGHAM.
SEWAGE UTILISATION.—The Flow of Sewage from the Main Outlet Sewer at Saltley amounts in volume to 15,000,000 of gallons daily, or thereabouts. By the system of intercepts adopted and now used by the Council, about 90 tons of solid sewage matter are daily removed at the Works of the Council, adjacent to the Main Outlet sewer at Saltley. The said Sewage Matter so intercepted and retained is considered to constitute a valuable Manure, and it is growing in public estimation for that purpose. The Council is desirous of NEGOTIATING with any Individual or Public Company for a CONCESSION of the WHOLE of the LIQUID and SOLID SEWAGE of the Borough produced at Saltley, and is willing to receive Proposals up on which to base such Negotiation.—Information on the subject may be obtained by personal application to the Borough Surveyor, Public Offices, Moor-street, Birmingham.—By order, THOMAS STANDERIDGE, Town Clerk.

Birmingham, December 1st, 1863.

CONTRACTS.

TO BUILDERS.—CLUTTON CHURCH, SOMERSET.—BUILDERS are invited to TENDER for the ENLARGEMENT and RESTORATION of the Parish Church of Clutton, near Bristol, and can see the drawings and specifications of the proposed Works at the Rectory House, Clutton, on and after MONDAY, the 14th inst. Tenders to be forwarded on or before the 31st inst., to the Architect, JOHN NORTON, Esq., 21, Old Bond-street, London, W. The Churchwardens do not bind themselves to accept the lowest or any Tender submitted.

CROYDON LOCAL BOARD of HEALTH.
PUBLIC NOTICE to ARCHITECTS, SURVEYORS, BUILDERS, CONTRACTORS, and all Persons interested in Building Operations.—Notice is hereby given, that from and after the 31st inst., any person BUILDING NEW HOUSES, or making any ALTERATION in existing buildings within the District of the Croydon Local Board of Health, must CONFORM to the provisions of the BYE LAWS of the said Board; and any person who shall in any way infringe the conditions described in the said Bye Laws will be liable to the penalties therein set forth.

BALDWIN LATHAM,
Engineer and Surveyor to the Croydon Local Board of Health.
Townhall, Croydon, December 5, 1863.

TO CONTRACTORS.—TO BE LET, the various WORKS required in the Erection of the Bradford Eye and Ear infirmary. Plans and specifications may be seen, and bills of quantities obtained at our Offices, Bradford, from MONDAY, DECEMBER 21st, to WEDNESDAY, DECEMBER 30th, on which last day sealed TENDERS must be delivered.—By order,

LOCKWOOD & MAWSON, Architects.
Post-office buildings, Bradford;
10, Lincoln's inn-fields, London.

CONTRACTS.

COAST GUARD CONTRACT.—NOTICE to BUILDERS and CONTRACTORS.

Persons desirous of TENDERING for the ERECTION of a COAST GUARD STATION at Fleetwood, in the county of Lancashire, may inspect the Drawings and Specifications at the Coast Guard Watch-room, Fleetwood, or at this Office, between the hours of TEN and FOUR, from MONDAY the 21st day of DECEMBER, to MONDAY, the 4th day of JANUARY, 1864, (new hour) evening, and both inclusive (Sundays and Christmas-day excepted).

Tenders to be sent to this Office not later than TWELVE o'clock at noon of the 5th day of JANUARY, under seal and directed to the Commodore Controller General of Coast-Guard, and endorsed "Tender for Fleetwood Coast Guard Station."

The Lords Commissioners of the Admiralty do not pledge themselves to accept the lowest or either of the Tenders.

Dated this 15th day of December, 1863, at the Admiralty,
Coast-Guard office, 12, Spring Gardens, London, S.W.

NOTICE to BUILDERS. Persons disposed to TENDER for the ERECTION of the various WORKS intended to be erected by the Herefordshire and South Wales Agricultural Improvement and Manure Company may inspect the drawings and specifications at the Office of the Engineer, Mr. THOMAS FLEWETT, C.E. 41, Tything, Worcester, on and after WEDNESDAY, the 23rd inst, up to MONDAY, the 28th inst. after that day up to FRIDAY, the 31st. at the Office of JAMES JAY, Esq. Solicitor, Hereford Bills of quantities will be supplied by the Engineer upon payment of one guinea. Tenders to be addressed to T. BADENHAM, Esq. Hereford, the Chairman of the Company, not later than MONDAY, the 4th day of JANUARY, endorsed, "Tender for Chemical Manure Works," after which date no Tender will be received.

41, Tything, Worcester, December 17, 1863.

TO BUILDERS and OTHERS.—The Commissioners of Sewers of the City of London will meet in the Guildhall of the said City, on TUESDAY, the 5th of JANUARY next, at Half-past TWELVE o'clock precisely, to receive TENDERS for the CONSTRUCTION of NEW SEWERS, and Works in connexion therewith, in Norwich-court (Fetter-lane), Jewin-cresent, and a portion of Down street, agreeably to plans and specifications to be seen at the office of the Engineer to the said Commissioners, in the Guildhall of Security will be required from the Contractor for the due performance of his Contract. The Commissioners do not pledge themselves to accept the lowest Tender, or any, unless deemed advisable; and no Tender will be received after TWELVE o'clock on the day of treate.

JOSEPH BAW, Principal Clerk.

Sewers Office, Guildhall, 17th December, 1863

VESTRY of ST. MARY, NEWINGTON, SURREY to BUILDERS and OTHERS.—The Vestry is desirous to have ERECTED a VESTRY HALL at DUPPAS, in the Walworth road, Newington, Surrey, and to receive TENDERS for that purpose. Persons desiring to submit such Tenders are invited, that they can see the drawings, specification, and form of contract, and obtain a copy of the bills of quantities, by applying to Mr. HENRY JARVIS, Architect, at his office, No. 29 Trinity square, Borough, Surrey, between the hours of TEN and FOUR o'clock. The Tenders are to be delivered at the Vestry-room, St. Mary's Church, Newington, on TUESDAY, 12th JANUARY next, at SEVEN o'clock in the evening precisely, previously thereto at our Offices as below, and must be accompanied by a sealed envelope, containing the names of two proposed sureties in 500*l.* for the due performance of the contract. The Vestry do not bind themselves to accept the lowest or any Tender.

H. & F. CHESTER, Joint Clerks to the Vestry.

1, Church-row, Newington butts.

TO CONTRACTORS and OTHERS.—A LARGE SPACE (probably forty Acres, more or less) within twelve miles of London, is required to be CLEARED of TREES and BUSHES within a limited time.—Apply by letter to C. D. Post-office, Wimbledon, Surrey.

THE MALVERN COLLEGE BUILDING COMPANY (Limited).—To BUILDERS. The Directors of the Malvern College Building Company are prepared to receive TENDERS for the ERECTION of TWO JUNIOR BOARDING HOUSES, at Malvern, on land adjoining the Proprietors College, now in course of erection. The plans, specifications, and conditions can be seen at my offices, at Malvern Wells (from MONDAY, the 28th inst. until MONDAY, the 4th JANUARY next. Bills of quantities will be supplied, free of charge, on application to me, either personally or by letter. The Tenders to be delivered or left at my office, in Abbey-street, Cheltenham, by NOON of the forenoon, on THURSDAY, the 14th of JANUARY next, and the Board will proceed to open the same at ELEVEN o'clock, when parties tendering will be expected to attend. Each Tender will be required to state the time required to complete the works, but the Directors do not bind themselves to accept the lowest or any Tender, and the party whose Tender shall be accepted will be required to provide two approved sureties, in the sum of 500*l.* for the due performance of the contract. The cost of preparing the contract and bond will be borne by the Guardians.—By order,

W. L. DIGGENS, Clerk to the Guardians.

Chelsea, December 16, 1863.

[*For remainder of Contracts see next Page.*

CONTRACTS.

URLESS FARM, CORSCOMBE, DORSET.—To BUILDERS and CONTRACTORS.—TENDERS are invited for the CONSTRUCTION of a NEW FARM HOUSE and OUT-BUILDINGS, at Urless Farm. Plans, elevations, sections and specifications may be inspected, on and after the 12th day of DECEMBER instant, at the office of Messrs. SLADE, solicitors, Beaminster; and at the Offices of Mr LEVERSEDGE, Surveyor, Taunton. Tenders are to be delivered as addressed on or before MONDAY, the 11th of JANUARY next, 1864. The Directors do not pledge themselves to accept the lowest or any Tender.—By order of the Directors, JONATHAN GILL, Secretary.

Oakworth, December 12th, 1863.

MILITIA STORES, BATH.—To BUILDERS.—Parties desirous of TENDERING for the ERECTION of the NEW STORE BUILDINGS for the 2nd Somerset Militia, at Bath, are requested to send me their names at once, and pay the sum of 10s 6d. for the bills of quantities and forms of Tender. The drawings and specification can be seen, and all information obtained, at my Offices, on and after the 23rd instant. The Tenders to be delivered to me sealed and indorsed, before TEN o'clock a.m. on 2nd JANUARY. The Committee do not bind themselves to accept the lowest or any Tender.

CHARLES J. PHIPPS, F.S.A. Architect.
5, Paragon buildings Bath, 10th December, 1863

NORTH-EASTERN RAILWAY.—DARLINGTON SECTION. The Directors are prepared to receive TENDERS for the following WORKS, viz.:—
The ERECTION of a STATION MASTER'S HOUSE, at Crook.
The ERECTION of SIX COTTAGES, at Barnard-on.
The ERECTION of an ENGINE SHED, at Saltburn by the-Sea.
Plans and specifications of the above may be seen at the Architect's Office, Northgate, Darlington, on and after WEDNESDAY, the 9th day of DECEMBER, and TUESDAY, the 22nd day of DECEMBER 1863. Tenders are to be addressed to the Secretary, and delivered at the Railway Office, Darlington, not later than TUESDAY EVENING, DECEMBER, 22nd, 1863. The Directors do not pledge themselves to accept the lowest or any Tender (signed) THOS. MAC NAY, Secretary.

Railway Office, Darlington, December 5, 1863

TO BUILDERS and CONTRACTORS.—Parish of Saint Pancras, in the County of Middlesex.—Notice is hereby given, that the Directors of the Poor of the said Parish will meet, at the Vestry Hall, King's-road, Pancras-road, on TUESDAY, the 29th day of DECEMBER instant, at TWO o'clock in the afternoon precisely, PENDELS for a gateway willing to CONTRACT for the ERECTION of WORKHOUSE WARDS, with DORMITORIES over, pursuant to plans and specifications, to be seen daily, on or after MONDAY next, the 14th instant, between the hours of TEN and FOUR o'clock, at the Office of Mr. WILLIAM BOOTH SCOTT, C.E. Chief Surveyor, of No. 10, Edward street, Hampstead-road, N.W., where the proper forms of Tender (and on which only proposals will be received) may be obtained. And the Directors of the Poor hereby give notice, that they will not supply quantities of the several work, or be in any way responsible for quantities which may be taken out by any person. Good security, to the satisfaction of the Directors, in the sum of £600, will be required for the due performance of the contract; and the names, descriptions, and written consent of two sureties, must be forwarded with each Tender. The Directors of the Poor do not bind themselves to accept the lowest or any Tender. Sealed Tenders to be delivered, addressed to me, at the Vestry Offices, King's-road, Pancras-road, indorsed "Tender for Enlargement of Workhouse," before TWO o'clock on the afternoon of the 29th of DECEMBER instant; and the party tendering or his agent must be in attendance at the said Offices at THREE o'clock p.m. on that day.—By order,

FRANCIS PLAW, Vestry Clerk.

Vestry Office, Pancras-road, N.W. 8th December, 1863.

TENDERS will be received for the ERECTION of a VILLA RESIDENCE at Addiscombe, near Croydon. Plans and specification to be seen at Mr. J. F. MATHEWS's Office, Surveyor, &c. Lowest or any Tender does not bind himself to accept the lowest Tender.

TO VALUERS.—POPLAR UNION.—Notice is hereby given, that the Assessment Committee of this Union are desirous of receiving TENDERS from Professional Valuers for MAKING a VALUATION of such Properties within the Union as may be required by the Committee. The Tenders are to be jointly and severally from two persons (not connected in partnership), fully competent to Value the Buildings and the Rateable Plant and Machinery; and such Tenders, stating the terms upon which it is proposed to make such Valuations, should be sent to me, addressed "Tender for Valuation," not later than the 4th day of JANUARY next. Parties Tendering are requested to be in attendance at a Meeting of the Committee, at HALF-PAST ELEVEN a.m. on TUESDAY, the 5th day of JANUARY next. The Committee do not bind themselves to accept the lowest or any Tender.—By order of the Committee,

JAMES RIPLEY COLLINS, Clerk to the Committee.

December, 14th, 1863.

IMPROVED WAREHOUSE, WHARF, AND OTHER CRANES.

Warehouse Crane.

Wharf Crane.

Travelling Crane.

Derrick Crane.

Quarry Crane.

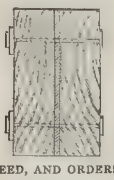
WAREHOUSE CRANE FOR GOODS WAREHOUSES, CELLARS, &c.

This Crane, which is much used in London for Goods Warehouses, Cellars, &c. is made wholly of Wrought Iron, and is represented as being attached to the front wall of a Warehouse by bolts passing through the top and bottom journals. The Windlass consists of two side plates, or cast-iron frames, having able winding gear, consisting of chain barrel, with spur-wheels and pinions on handle-shaft.

PRICES, DELIVERED IN LONDON.

No. 1.	Warehouse Crane, complete, to lift 10 to 15 cwt. single purchase	£37	10	0
No. 2.	Do. do. do. to lift 15 to 20 cwt. double purchase	45	0	0
No. 3.	Do. do. do. to lift 20 to 40 cwt. do. do.	50	0	0

Fixing, exclusive of Brickwork or Carpenters' Work, £3 10s. to £5 extra.

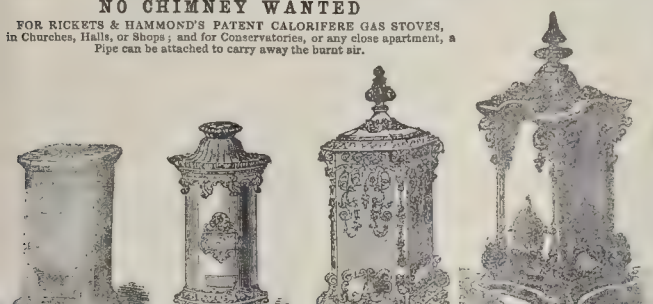


One of these Cranes, which J. BROWN & CO. have just erected, may be seen almost constantly at work at Messrs. HUNT & CROMBIE'S new Warehouse, corner of Philpot-lane, Eastcheap. It is one of the most efficient Cranes ever erected in London, and being especially designed to suit the character of this fine building, the Crane is no less remarkable for its neat appearance than for perfect strength and efficiency, combining every improvement in working—raising and lowering goods from the street to every floor of the building, with very great saving of time and labour, compared with the ordinary old-fashioned Crane.

N.B.—Cranes to lift light weights, with simple crab winch, at lower prices.

***** Prices of Wharf or Railway Cranes, Portable or Travelling Cranes, Derrick and Quarry Cranes, on application; also of Upright Stationary Steam Engines, Steam Cranes, and Contractors' Locomotives.**

WROUGHT IRON GIRDERS, FLITCH PLATES, AND TANKS.



QUALITY OF MATERIALS AND WORKMANSHIP GUARANTEED, AND ORDERS REQUIRING DESPATCH PROMPTLY AND PUNCTUALLY EXECUTED.

J. B. BROWN & CO. 18, CANNON STREET, CITY.

All Goods at the lowest Wholesale Prices. Illustrations and particulars sent upon application.

No. 18, KING-STREET, SNOW-HILL, LONDON, E.C.

HOBBS, HART, & CO.'S
MACHINE-MADE LOCKS AND STREET-DOOR LATCHES.

These Locks are recommended for all purposes requiring good ordinary security combined with economy of price and durability of wear; as, by means of machinery, a faultless accuracy is arrived at which by hand-labour would be impossible except at a greatly increased cost.

The security of these Locks consists in a series of Levers that have to be raised to unequal positions by the bits of the key before the bolts can pass. These will bear comparison with those at treble their cost.

These Locks are made from two to five levers, and also in suits to differ, with master-keys to pass.

The retail prices for Cabinet purposes is from 2s. to 4s. each; for Room Doors, 4s. to 9s. 6d. each; Street Door Latches, 7s. 6d. to 18s. each.

The 2-bolt 4-lever Mortise, with Hobbs & Co.'s Patent Follower, price 8s.

HOBBS, HART, & CO.'S PATENT PROTECTOR LOCKS.

300 Guineas were offered in the late Exhibition to any one who could Pick these Locks in thirty days. Their speciality consists in their combining the two essentials of security, viz.—protection against picking, by means of their Patent Moveable Lever Protector, and protection against illicit tampering with the Lock through the key-hole, and also tampering with the key, by means of their Patent Nozzle Protector. These all-important principles are the special and peculiar features of HOBBS, HART, & CO.'S Patent Locks. These Locks vary in price from 10s. to 50s. each, with solid keys. For prices with changeable keys, see 16-paged Illustrated List of Locks, Iron Door Safes, &c.

Agents Wanted.

SMOKY CHIMNEYS.

S. DEACON

Respectfully invites the attention of Architects, Builders, &c. to his

PATENT LOUVRE CHIMNEY CAP,

which has been in use some time with perfect success, many strong chimneys where other caps have been of no avail.

The advantages attending this Cap are, it can be thoroughly cleaned by the machine when the chimney is swept, the brush being able to pass through the Cap without the possibility of misplacing it, an increased draught, and the impossibility of a down one.

Prospectus forwarded on receipt of Postage Stamp, by

S. DEACON,

THE INTERNATIONAL EXHIBITION PRIZE MEDAL, AWARDED 1862

ESTABLISHED 1744.

AUSTIN'S IMPERIAL PATENT SASH

and BLIND LINES.

To BUILDERS, CARPENTERS and BLIND MAKERS

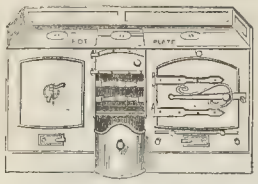
J. AUSTIN, Manufacturer of the above articles, particularly wishes to direct the attention of the Trade to his

IMPERIAL PATENT FLAX SASH-LINES,

of which he is now making four qualities, and he strongly recommends that in all cases they should be purchased in preference to the PATENT LINES made from hair, which article has neither the STRENGTH nor DURABILITY of flax, consequently cannot give so good satisfaction to the purchaser.

They can be had of all Ironmongers, Iron Merchants, Factors, and Wholesale Houses, and in the Trade only

BROWN & GREEN'S
PATENT KITCHEN RANGES.
PRIZE MEDAL, 1862.



These Ranges combine the latest improvements with great simplicity and durability. They afford facility for roasting meat in front of the fire without interruption to the action of the oven, hot plate, boiler, &c. The Ovens are well ventilated, and perfect either as roasters, or for baking bread or pastry. For Efficiency, Economy, and Ventilation, and

CURE OF SMOKY CHIMNEYS,

these Ranges are unequalled. They are of all sizes and prices; and when fitted with Bath and Steam Apparatus, &c. they form the most complete appointment for good establishments. Designs, &c may be had on application at THE LONDON WAREHOUSE,

72—74, BISHOPSGATE STREET WITHIN.

"One of the best arrangements of the 'Kitchener.'"—See *Builder*, Sept 6, 1862.

THE LEAMINGTON PRIZE KITCHENER.

These Ranges are strongly recommended for Economy, Cleanliness, and a Cure for Smoky Chimneys.

The Top forms an entire and efficient Hot Plate, and having an Open Fire, removes all the objections of a Close Fire-range.

A large STOCK of SELF-ACTING and other RANGES, REGISTER STOVES, and every description of BUILDERS' IRONMONGERY, at Wholesale Prices.

All Goods delivered free within Five Miles.

BARTON'S PATENT PRIZE MEDAL STABLE FITTINGS.

These SUPERIOR CLASS STABLE FITTINGS are PATRONIZED by the PRINCIPAL NOBILITY, and ADOPTED by many of the FIRST ARCHITECTS and BUILDERS of the United Kingdom.

J. BARTON solicits attention to the NEW STABLE just completed, with full size Stalls, Loose Boxes, and Harness Room, now open for inspection, at the Manufactory, 370, Oxford-street, where an extensive assortment of all kinds of Stable Furniture, upon the most modern and improved principles, are to be seen.

A new Illustrated Catalogue, with numerous engravings of the improved method of fitting up Stables, forwarded on receipt of four stamps.

JAMES BARTON, IRON WORKS, 370, OXFORD STREET, LONDON, W.

MUSGRAVE'S PATENT STABLE AND HARNESS FITTINGS.

MUSGRAVE'S PATENT HARMLESS LOOSE BOXES, MUSGRAVE'S PATENT IRON COW-STALLS AND PIGGERIES.

Architects who have not seen these Fittings are requested to write for Engravings, as they are unlike those of any other maker, and were admitted to excel all the work of the kind in the Exhibition. They are now extensively adopted in almost every county in England; and MUSGRAVE, BROTHERS, are now fitting several very large establishments in the Italian style of Domestic Architecture, noted for adopting only what is the best of its kind. Particulars of these, as well as of MUSGRAVE'S PATENT SLOW COMBUSTION STOVE, will be forwarded on application to

MUSGRAVE, BROTHERS, ANN STREET IRON WORKS, BELFAST.

DRAUGHTS & DUST ROUND DOORS & WINDOWS

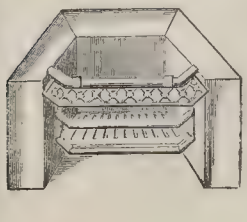
THE IMPROVED OPEN FIRE KITCHENER,

Manufactured by

WM. OWEN, PHŒNIX IRON WORKS, ROTHERHAM,

Possesses all the advantages of the ordinary Close Fire Kitchener, in having excellent Hot Plates on top of Ovens, for boiling, steaming, or stewing, with the additional advantage of having a thoroughly effective and deep OPEN Fire for roasting purposes.



The Ovens are heated upon Bradley's Patent Principle (under which W. O. possesses the sole right to manufacture), and by which a great economy of fuel is effected.

These Kitcheners are made of all qualities and sizes, suitable for all classes of houses, from the cottage to the mansion; and can be OBTAINED THROUGH ANY IRONMONGER in the UNITED KINGDOM.

VIEILLE MONTAGNE ZINC.

THE ITALIAN-FORMED ZINC is much approved of by Architects and Engineers on account of its strength, durability, and appearance. On account of the light framing required, roofs, including framework and fixing, can be covered with it FOR £3 PER SQUARE up to 25 feet span. Sheds of larger span, including posts, 4*d.* per square. Architects are cautioned against allowing anything thinner than No. 13 gauge (20 oz.) to be used. ALL PLATES SHOULD BE REJECTED NOT BEARING, in addition to the Company's name, the words "ROOFING ZINC," and the gauge.

OLD ZINC RETAKEN AT HALF THE MARKET PRICE OF NEW.

For Designs and Estimates for Roofs, with Timber or Iron Framework, IRON CHURCHES COVERED WITH ZINC, and Buildings for the Colonies, apply to

DESACHY'S FIBROUS PLASTER.

GEORGE JACKSON & SONS,

HAVING BECOME THE PROPRIETORS OF THE PATENT RIGHTS IN

DESACHY'S FIBROUS PLASTER,

Beg to call the attention of Architects to its Capabilities.

It is adapted for the speedy and economical production of any coffered or circular work, waggon-headed ceilings (all bracketing being avoided, as it is fixed to the joists direct), flute I and plain columns, panelled dados, all kinds of diaper, &c.; for the linings of walls and ceilings, and for all purposes of ornamental plaster.

The advantages are great. It is of great lightness and of excellent quality; it is not inflammable, and is ready to be painted immediately after it is made; it has been used (under the direction of Owen Jones, esq.) for the ceiling of St. James's Hall; at Messrs. Oiler's, Oxford-street; Mr Hancock's, New Bond street; the Crystal Palace Bazaar; the Home for the Aged, South. Lambeth; and at various other Works.

SPECIMENS CAN BE SEEN AT 49, RATHBONE PLACE.

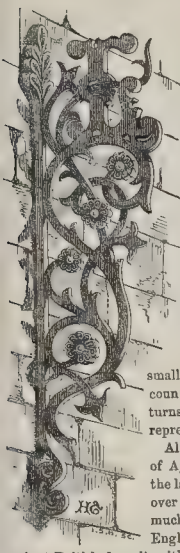
VALUABLE DRAUGHT HORSES. Mr. R. AUSTIN is instructed to SELL by PRIVATE TREATY, several valuable Young and Powerful CART HORSES, suitable for Contractors, Brewers, and others, the property of a gentleman, who, having adopted a steam cultivation, has no further use for them. They are stylish and well matched, and will be sold separately or together.—For particulars, apply to RICHARD AUSTIN, Auctioneer, Bishop's Waltham and Southampton.

WELL-BURNT BALLAST.—About 3,000 LOADS FOR SALE, at 1s. 9d.; if 100 Loads are taken price 1s. 6d.—Apply to the Lodge-keeper, Maitland Park, Haverstock Hill, near the Chalk Farm Gate

PENCILS, BLACK LEAD, and COLOURED CHALKS.
A. W. FABER'S CELEBRATED LEAD PENCILS.
Sole Agents, HEINTZMANN & ROCHUSSEN, 9, Friday-street, E.C.
SOLD BY ALL STATIONERS AND ARTISTS' COLOURMEN.

BRYCESON'S ORGAN FACTORY, BROOK STREET, EUSTON ROAD, LONDON, N.W. Established 1795.—Apply for PRICED CATALOGUES of Specifications, Testimonials, and other Organs, readily in Stock. Also as to the Tuning, &c. of Organs in all parts of the country. Church Organs of any size built, enlarged, or revolved, as well as removed and WAREHOUSED DURING RESTORATIONS. PRIZE MEDAL, 1851.



TRUSSES, VASES, FOUNTAINS, BALUSTRADES, CHIMNEY-PIECES, MIGNIONETTE BOXES, &c.—The premises at Cole-row being required for the Thames Embankment, the Patent Concrete Stone Company, Limited, are obliged to clear off the remaining Stock, and therefore offer the same at greatly reduced prices
7, Cannon-row, Westminster, December 7, 1863.

PARQUETS SOLIDAIRES.—HOWARD & SONS, 26 and 27, Berners-street, are prepared to supply Machine-made Patented Solid PARQUET FLOORS 50 per cent. cheaper than they have been yet offered. Illustrated Catalogues plans, and estimates free.

The Builder.

VOL. XXI.—No. 1089.

Buckinghamshire: Condition of the Agricultural Districts.

LEAVING for a time the closely-packed residents of towns, we are led to make some inquiries into the condition of things in the agricultural district around Buckingham. A branch of the North-Western Railway line—straight as an arrow—brings us from Cheddington Station, a place at present in a sad state of incompleteness and bad roadways, to Aylesbury, the county town of Bucks, one of the smallest of the English counties, but which returns five members to represent it in Parliament.

Although the population of Aylesbury, according to the last census, is not much over 6,000, the town has much importance in old English history. In the ancient British days it withstood assailants until the year 571, when it was reduced by Cuthwolf, the brother of the King of the West Saxons. After that the town derived great fame from Eadburg and her sister Edith, who were, as tradition says, two holy virgins, the daughters of a king or Mercian prince. Aylesbury became much frequented in consequence of the holiness of St. Edith, and the town was allotted to her as a dowry by her father. The particulars in connexion with this lady seem rather vague; but about the beginning of the seventh century the town became famous as the burial-place of St. Osyth, who was born near here, and murdered in Essex. She is said to have been contracted in marriage to a king of the East Angles, but on the day of her espousal retired to lead a religious life. She built a monastery, and suffered martyrdom during one of the incursions of the Danes. The remains of this lady, who, according to the tradition, was beheaded near the bath she had been accustomed to frequent, were interred in the church at Aylesbury, and a religious house was erected to her memory on the site where the present rectory-house now is. William the Conqueror seems to have done mischief here, for the lands were taken from the original owners, and given to a favourite of the ruler, under the tenure of providing straw for his bed three times a year, three eels in winter, and three geese in summer. Through several centuries the town of Aylesbury kept its place, and in the reign of Queen Mary, 1553-4, it was incorporated by charter, and still retains the privilege of returning two members to Parliament.

Turning, however, from things of old time to those of the present, it should be mentioned that Aylesbury is a pleasant little town, which stands on an elevation, and might, if all were rightly managed, be one of the most healthy spots in England. The death-rate in comparison with that of some other places is not excessive, being about twenty-five in the thousand of the population. Right sanitary measures would reduce those deaths to about nineteen or twenty in the thousand; and it is with great satisfaction we find that earnest men in this little town are striving in the right way to effect improvement. For instance, the town has been provided with main sewers; and there is a chance of testing the value of town sewage, and the right way of managing it. Respecting the extent to which the convenience of drainage has been made available, we will by-and-by remark. It is, however, evident that there are men in Aylesbury at work, not especially connected with agriculture, who are anxious to make this town what it should be. Go where you may in the neighbourhood you hear the names of the Rothschilds mentioned in connexion with all good works. On the land in their possession the cottages of the labourers are not demolished without the provision of others of a better kind. On the Creslam estate, which is said to have some of the finest land in all England for cattle-feeding, the person who has possession, Mr. or Mrs. Rowland, has levelled the cottage dwellings to the ground and put none in their place: this, however, is a matter for observation hereafter.

The new Infirmary has an excellent site: on all sides are pleasant views, and the air is bracing and healthy. The colour of the foliage which is left, the grass, the bright rich brown of the feathers of the sparrows, show how comparatively pure the air here is. The wards are lighted from each side, and at the end of each a large circular-headed window affords the opportunity of a fine view over the adjacent country. The ceiling and walls throughout the building are of Parian cement, which is polished as bright as marble; the floor is of polished oak; all the furniture is of the same material, so that there can be but little chance of the absorption of impurities, as was the case in the last hospital here and in the old *Dreadnought* ship in the Thames. No cooking of any kind is allowed in the sick wards; and sculleries and places for preserving the provisions of patients are expressly provided. The closets are also so arranged that contamination of the atmosphere of the wards can scarcely happen.

The walls of the wards are of a delicate rose colour, which is cheerful to the eye. While in the old hospital the cures were few, in the new building the results of treatment have been very satisfactory. The reception-room for out-door patients, by the way, is not satisfactory, and should at once be altered.

The dilapidated condition of many of the cottages in various parts of Aylesbury, is extraordinary: we would especially notice some at no great distance from the church. Spring Gardens, Whitehall, as the locality is named, is one of those neglected places. Here are several dwellings, some of which stand in rows of three or four houses, each consisting of a small room on the basement, and a still smaller apartment above. We give a sketch of one of those dwellings;* the yard in front is partly paved in an irregular manner, that does not prevent the absorption of the refuse which is thrown here. In some instances the broken and dilapidated spouts serve for the collection of part of the rain-water in small casks, but the chief portion runs from the eaves and sinks into the basements of the houses. The water for domestic purposes is obtained from wells, some of which are provided with rollers, ropes, and buckets: in other cases, however, there is nothing over the top of the well except some broken boards. Although sewers have been carried through the chief thoroughfares, and the gully-holes carefully trapped; still there is no doubt that here as is the case in the metropolis, there is much required to be done by the Local Board of Health in compelling the owners of property to take drains into the sewer where the houses are within the legal distance from it. There is a sanitary inspector, and he is assisted by members of the Board of Health; it is, therefore, hoped that before long the drainage of cottages and other dwellings will be completed. When this is done, and a better water-supply provided, a decrease of the present death-rate may be looked for.

In some of these cottages we found excessive poverty. In one house there were a man, his wife, and five children. He was generally employed in various ways upon the neighbouring lands, but, owing to an accident, had been out of work for upwards of ten weeks. Even in the best of times, his earnings were not more than from 10s. to 11s. a-week; and here, as in other parts of this district, there were complaints that the uncertainty of obtaining constant employment materially lessens the general income. Unless something be done to this cottage in the way of repair, the roof will most likely fall upon the inmates. In another cottage a man was "awfully bad," as he said, "with rheumatics." This was not to be wondered at, for the ill-built walls and floors were saturated with damp. The houses are planted on the ground, and the flooring consists of indifferent brick-work, repaired here and there with stone. There is no opening for the purpose of ventilation at the backs. In another row of cottages of the same pattern as those just mentioned there were serious cases of fever. The well was in dangerous proximity to the filth from the houses and piggeries. Here, too, as in other parts, there is an indecent neglect of closet accommodation. We might continue at considerable length to notice dwellings of a similar description in which there were complaints of sickness, and the usual account of the death of half or more of the children. The rent of these small two-roomed cottages is from 1s. 6d. to 2s. a-week, a small sum, but which many of the poor with difficulty manage to pay.

In the central portion of Aylesbury, the Market-place, there are several very ancient houses. Some of the inns, and the old-fashioned hanging signs, are especially worth notice; and, as regards the latter, it is to be remarked that some of them deserve preservation for their artistic merits, and as examples of a style of English art which has nearly passed out of use. The sign of the Cock is well painted, and is in an excellent state of preservation. An old inhabitant remembered this sign sixty years ago. The King's Head, bluff Harry VIII., is characteristic; besides these there are the Angel, the Cross Keys, the Red Lion, the Crown, the Dun Cow, the White Hart, and other places of old note.* The last-named house, although the front has been modernized, still retains at the back the architectural features of Charles I.'s reign. The King's Head still shows many of its original points belonging to Henry VII.'s or Henry VIII.'s reign. The kitchen is very picturesque. The proportions of this apartment are large, the stained glass and leaden frame-work still remain in the window; the table, dressers, the moulded oak beams of the roof, the open fire-place, a stag's head with immense antlers, the head being of wood, painted black, the peculiar window-curtains, and other features, form a scene, which, but for the gas-pipes, the notices of railway trains, and the earthenware plates and dishes, has been little altered since the time when Shakspeare may have passed this way.

Behind the Bull's Head Inn there is a range of dwellings which requires the especial care of the local board of health of this town. Here are about thirty small dwellings, most of them in a bad state of repair, and for which there is even now only the provision of two closets. Until recently there was but one closet for the use of all the people who lived in this unwholesome situation. We need not remark further upon the evils certain to result from such a disgraceful state of things as this.

* See p. 897 for this and other illustrations of the statements here made.

* Many of these were either painted or restored by an artist named Hodgkins. He died at an advanced age not long since, and there does not seem to be any one to fill his place. The Wagon and Horses at Stone, near Aylesbury, is a good example of his skill.

Besides the neglect of closets, the drainage of houses into the main sewers, and some other matters to which we have above referred, the present water supply is an especial evil and inconvenience. The soil is of a porous description, and the numerous wells which are here and in the villages cannot fail to be more or less polluted. At the Infirmary a well has been sunk to a considerable depth, and from this a plentiful supply of water, at present very good, is raised to all parts of the building. Formerly, the prison stood in part of the market-place, and it was the duty of the inmates, by the means of a treadmill or some such contrivance, to raise water for the supply of the town. Now, the gaol having been removed, the water is carried by bearers, as it was formerly in London. The water brought from some neighbouring brook is sold at the rate of 8d. a load. The proprietor of one of the market-place inns said that he required four of these in a week, and that he was obliged to keep his stables empty in consequence of the want of sufficient water for the horses, even with the help of a well and rain-water. The cost of the water purchased by him of the bearers amounted to more than 6*l.* a year. In order to remedy this defect, it is proposed to incorporate a company to supply water for domestic, trade, sanitary, and other purposes, within the townships of Ashton Clinton, Buckland, Weston Turville, Bierton-with-Broughton, and Aylesbury, with its hamlet of Walton; and power from Parliament will be asked for next year to construct and maintain service reservoirs in a field on a high point of land near Tring, in the parish of Buckland. This plan has been favourably received, and will, it is hoped, be speedily carried out.

During six days of the week the town is quiet enough, but on the market day, Saturday, great is the change: from all the roads which centre here flock crowds to buy and others to sell. The scene in the market-place is both bustling and pleasing. The canvas-covered stalls set over the space, the crowded sheep and cattle pens, the showmen, the bellman, the dealers in tea, quack medicines, &c., &c., crowd the spot; and it may be just worth while to remark that the cost of the site of a movable stall or other selling-place in this market is not more than from 4d. to 6d., and the price of butcher's meat is,—pork, 5½d. per lb.; beef, prime parts, 8d. per lb.; loin of mutton, 7d. per lb.

We must, however, pass through this crowd into the fields, by the road towards Tame. Going in this direction, the church and town of Aylesbury appear to much advantage, and it cannot fail to strike an observer that the situation of this place is well adapted—in the centre of an agricultural district—to the utilising of the sewage of the population upon the neighbouring land, instead of sending it in waste to contaminate the streams of the Tame and the Thames. Few places are better situate for easy and effective drainage than Aylesbury. Along this road, and the others which branch from this old town in various directions, the wide extent of pasture and other land, with but few places of human habitation, produces surprise in a stranger. In this direction, for about three miles after leaving Aylesbury, there is scarcely a cottage-dwelling to be seen. The country, however, even in December weather, is beautiful. On this road is the finely-situate dwelling of Dr. Lee, of scientific note, who has collected a large and valuable museum of geological and other specimens, which have been for the most part obtained in this district. The house of the doctor has no particular architectural merits; but the surrounding parts are pleasant to the eye, and amongst the pine and other trees which fringe the road and ornament the park, a landscape painter would meet with rare studies. The wall of the park is of itself worthy of note; it is strongly built of hewn stones, won from the quarries, with ammonites and other fossils inserted here and there in the way of ornament.

Complaint comes from various quarters that Dr. Lee is careless of his cottage dwellings; that he has within a very short time demolished about twenty cottages which had been occupied by persons who were engaged in the cultivation of his land; and that the men, their wives and families, are driven to find shelter in the back-slums of Aylesbury. "It be hard," said a man, "to get to work in the season at five o'clock, and have to walk four miles, morning and night." It vexes us to note this want of wisdom. There are, however, some cottage dwellings still left on this estate, which are of the most discreditable description; and it is clear that little thought is given to sanitary requirements. Take, for instance, Hartwell, a small hamlet, situate at a little distance from the main road. Here there has been some whitewashing done; but this is only a disguise. Often, in years long since past, we have looked at picturesque homes, with the thatched roofs decked with mosses and lichens, and the walls covered with jessamines, roses, and other flowering plants; but now, although our taste for those combinations has not declined, painful experience causes us to look further. But before proceeding to give some details of Hartwell, it is worth while to note that throughout eight-tenths of the agricultural district there is no intelligent care shown for sanitary arrangements. Hartwell is a remarkable instance of this. Besides the bad construction of the houses, the drainage, if attempted at all, is so managed that, instead of carrying the poisonous refuse to a proper distance, it lodges it before some other person's door.

There is a group of cottages at Hartwell, arranged so as to form two sides of a small square; one of the other sides comprises a range of pig-styes, in parts of which are heaps of offensive matter. There is not even surface drainage here: the earth must be polluted to a great depth by what is thrown on the surface; and of course part of this must find its way into the well, which is sunk in a portion of the square. It was mentioned that a farmer not far distant would be glad to arrange for the transport of the sewage of this place to one of his fields; where, instead of being a nuisance, it would fertilize the land. On the opposite side of the road there are other cottages. Ten of these, in the rear, have been drained,—in a partial manner,—but the refuse has been brought by pipes to the front of other houses, where, in consequence of the want of proper channels, it lodges, and causes the greatest annoyance and danger.

A chief fault in nearly all the cottage-dwellings in Buckinghamshire is the smallness of the rooms. On this point we shall give some notes. It is impossible to preserve the health of families in such space. The greater number of the people who live in them are much out of doors during the day, where the air is clear and health-giving; but at night we found nine, ten, and more persons in a space of breathing-room not much larger than the united accommodation that would be provided by a coffin for each.

On the way from Aylesbury to Dinton, the Church of St. John, at Stone, a small village, is worthy of notice. About here the land is marvellously productive, and that, too, without any great amount of farming. In cuttings which have been made for quarries, the great depth of the surface soil is seen, and the favourable strata which lie below,—sand, lime, stone, and materials for brickmaking. Wood for building purposes can also be readily obtained. So here, notwithstanding the defects of the cottage dwellings, we may have, at a small cost, all the materials required for their construction, and the ground-rent of land for them should not be an obstacle. Here we met with some practical men, who seemed to understand the subject, and said that they could build roomy and convenient cottages for the reception of families, in groups of about four houses each, at a cost of 70*l.* for each cottage, which could be readily let for 2*s.* a week, or more,—5*l.* 4*s.* a year.

On this road, which, like others that lead to Aylesbury, is admirably kept, and has wooden seats at intervals for tired wayfarers on the Dinton road, is the County Lunatic Asylum; and there is also to be noted an artificial ruin, or "Folly," a singular combination of architectural incongruities, showing the fossil decoration similar to that in Dr. Lee's park. Standing as it does on a bold elevation, in the midst of tall pine-trees, the stonework now overgrown with lichens and greenery, the "Folly" looks well at a distance.

The cottage-dwellers in the country have in one respect the advantage over the inhabitants of Bethnal-green, and many other town districts, for when they leave their crowded and unhealthy homes, they may get pure breezes; not generally to be had by pent-up citizens. Still, perhaps the danger of the cottage homes, as regards fever and other pestilence, is not less than the tenemented dwellings of the industrious and poorer classes in towns, for the contrast between the outer air and that in the ill-drained and crowded cottages is greater in the country than in dense populations. The small size of the cottage rooms is, we repeat, a serious evil. In each of several of these places, which consist of two apartments, one above the other, there were lodged families, eight, nine, and more in number. The size of some of the interiors, at Gibraltar and elsewhere, is, in the lower room, 12 feet by 9 feet, and less than 6 feet in height, a cubical space of 648 feet. The height of the upper room, where in nine cases out of ten the majority of the family sleep, is barely 5 feet, which gives about 540 cubic feet of space. In the Aylesbury Infirmary there is an allowance of 1,500 cubic feet to each patient. In the Surrey County Prison, each cell contains 819 cubic feet; Knutsford House of Correction, 910 cubic feet; and the Manchester City Prison, 834½ cubic feet. It will thus be seen that the room for a single prisoner is greater than that in the sleeping apartment of the agricultural labourers, in which it is not uncommon for nine persons to rest during the night. According to the prison allowance we ought to have for such a family a space of more than 7,000 cubic feet. We cannot wonder, then, without reference to other sanitary derangements, that fevers and other preventible illnesses should be common visitors. In Manchester it was found in certain districts, that when cholera attacked classes of houses having more than nine inhabitants in each, one case in a hundred of the population was fatal; where the number of the inhabitants was seven, it was fatal in one case in 130; where the number was six it was fatal in one case in 170; but where the number of inhabitants was not more than five, it was fatal only in one case in each 500.

While on the road we met with a cavalry officer of experience in the conveyance of horses on shipboard to the Crimea and elsewhere, who said that the great difficulty had been to supply them, when pent up together, with sufficient air: this, with considerable labour they punkered into the hold. When a storm came, however, and the captain of the vessel ordered the hatches to be closed, glanders and chest diseases broke out, and great mortality of the animals was sure to result. As with horses and with other animals, so is it with human beings, who in a polluted atmosphere will as surely perish.

The village of Dinton is in the Aylesbury Union, four miles north-west of the town of Aylesbury. The church, dedicated to St. James, is a large and venerable structure, which has been put into good repair. The south door of this church is of the Norman period, but other parts are more modern. Close by is an ancient mansion, which was formerly in the possession of Sir Simon Mayne, one of those who sat in judgment on King Charles I. It afterwards passed into the possession

of Mr. Goodall. Amongst the curiosities which have been collected here, is one of the shoes formerly worn by John Bigg, better known as the Dinton Hermit, who is supposed to have been the executioner of King Charles. He lived for many years in a cave in this parish, without even changing his clothes; mending them when necessary by placing over the decayed parts cloth or leather. By this process the shoes have become of ten times the original thickness. This mansion, which has been renovated, is a good example of a large country residence of the early part of Charles I.'s reign. Near the church there is a row of two or three dwellings, stone-built, and a story higher than most of the others in the district. In one part of the basement there is a school for girls: this is a primitive place, but the copy-books were satisfactory. There is also a small school for boys, and here and there throughout the district schools are thinly scattered. Notwithstanding, if we may partly except Aylesbury, the education of the children of the labourers, is in a very unsatisfactory condition. In the course of inquiry we found that many who have reached the years of maturity, and others of a younger age, cannot write their own names; we cannot, however, in justice say that matters are worse in this respect than they are in the eastern and some other parts of London. In a room of one of the houses in which the girls' school at Dinton is carried on, were an aged man and his wife—the latter in very bad health—who declared, and we believe truly, that they were more than half starved upon a small pittance that they received from the parish. Although there are several rooms here unoccupied,—and there is a great difficulty in getting houses in this part, especially for families,—these are kept empty by the proprietor, rather than have persons in them who perhaps might at some period become chargeable to the poor-rate of this particular parish. To this feeling much of the present evil condition of cottage dwellings is to be attributed; for instead of striving as owners ought, in justice to those on whose strong hands and strong limbs the successful cultivation of the land mainly depends, to provide houses for their workpeople, in which health and decency might be preserved, it has become the custom, especially where much land is in the possession of one proprietor, to drive the labourers to distant towns and villages, for the purpose of keeping pauperism from particular districts, and making it chargeable elsewhere. In the course of our visit to Buckinghamshire, we have had conversation with several landowners, farmers, some of the most intelligent of the workpeople, and persons who have thought much of these matters, and find there is a strong and growing opinion, that in order to effect any real amount of good, we must have an entire change in the law affecting the settlement of the poor.

We have already alluded to the demolition of the cottages on Dr. Lee's land; but matters are not so bad even there as they are in some other parts. At Creslow, the estate already referred to, which contains 1,000 acres of the best pasture land in Buckinghamshire, and perhaps in all England, there was in 1851 a population of ten, and at the present time there is but one labouring man who resides on this fine estate.

Those owners who are best disposed towards their work-people, and who would build cottages at some pecuniary loss, for their reception, are disheartened in such useful attempts by the circumstance that men and their families who are connected with other land flock to them and increase the poor-rate, while owners who make no attempt to do their duty in this way are relieved of expense; and this evil, by the present process, must, as a natural consequence, continue to increase. This is a point in the cottage-dwelling question which must, before long, be brought to the notice of the Legislature.

If the present system, which leads to overcrowding and other evils, be continued, we shall have in the health-giving country a coming population deteriorated in every way. There is more to be said as regards this—after a glance at the cottages on the estates of the Duke of Buckingham, Baron and Sir Anthony Rothschild, the Duke of Marlborough, and others,—but we will first walk through the village of Dinton, and thence to Gibraltar,—a settlement which has a most evil repute amongst the places where, owing to bad sanitary conditions, pestilence is a visitor.

ARCHITECTURE AND THE ROYAL ACADEMY.*

IN "Supplementary Evidence," in a letter to Lord Elcho, Mr. Watts thinks, like several other witnesses, the Academy should institute experiments as to the durability of colours and *media*, and ought to investigate the causes of failure in frescoes; also that it ought to make proof of the applicability of mosaic. Referring to his recommendation as to providing students with wall-space whereon to try their strength, he writes,—

"I insist upon mural painting for three reasons; first, because it is an exercise of art which demands the absolute knowledge only to be obtained by honest study, the value of which no one can doubt, whatever branch of art the student might choose to follow afterwards. Secondly, because the practice would bring out that gravity and nobility deficient in the English school, but not in the English character, and which being latent might therefore be brought out; and, thirdly, for the sake of action upon the public mind. For public improvement it is necessary that works of sterling but simple excellence should be scattered abroad as widely as possible. At present the public never see anything beautiful except in exhibition-rooms, when the novelty of sight-seeing naturally disturbs the intellectual perceptions. * * *"

He notes that few artificially produced objects about us have real beauty, though the love of beauty is inherent in the mind: "some unfortunate influence" then, he thinks, is at work, and that to counteract it should be the object of a fine-art institution. Had earnest efforts been made by the Academy during the last fifty years, he "cannot believe they would have failed to create a great school." The peculiar qualities of English character and history are almost entirely without corresponding expression in English art, and looking at what was done before the Academy existed, he "cannot see any distinct evidence of important influence to be ascribed to it."

Mr. Ruskin's evidence is marked by some contradictions, but it accords in several respects with what has been said by others, and is suggestive throughout. As to the effect of the methods of teaching in the Academy, upon the art of the country, we find the following question and answer:—

"5993. What should you say was that effect?—Nearly nugatory; exceedingly painful in this respect, that the teaching of the Academy separates, as the whole idea of the country separates, the notion of art-education from other education, and when you have made that one fundamental mistake, all others follow. You teach a young man to manage his chalk and his brush—not always that, but having done that, you suppose you have made a painter of him; whereas to educate a painter is the same thing as to educate a clergyman or a physician—you must give him a liberal education primarily, and that must be connected with the kind of learning peculiarly fit for his profession. That error is partly owing to our excessively vulgar and excessively shallow English idea that the artist's profession is not, and cannot be, a liberal one. We respect a physician, and call him a gentleman, because he can give us a purge and clean out our stomachs; but we do not call an artist a gentleman, whom we expect to invent for us the face of Christ. When we have made that primary mistake, all other mistakes in education are trivial in comparison. The very notion of an art-academy should be, a body of teachers of the youth who are to be the guides of the nation through its senses; and that is a very important means of guiding it. We have done a good deal through dinners, but we may some day do a good deal more through pictures."

Elsewhere, Mr. Ruskin speaks of the "sort of scorn which all the teaching and education at Oxford and Cambridge, tends to give for art and artists." Mr. Tom Taylor, we may here note, doubts if the Academy has elevated the artists of this country, except socially; and whether it now exercises an influence of an ennobling or beneficial character, the education being most defective, whilst the exhibition "popularizes" art, but "does not raise it." Mr. Ruskin "would have the Academy education corresponding wholly to the university education;" the boy having begun drawing at school, should come to the central university of art, where whilst being taught to paint, and to carve and to work in metal, "the chief attention of his governors should be to make a gentleman of him in the highest sense; and to give him an exceedingly broad and liberal education, which should enable him not only to work nobly, but to conceive nobly." Mr. Armitage had just before expressed opinion against a test of general education, in addition to the other, for the admission of students, saying there would be risk of excluding very able artists, and instancing that Claude de Lorraine could hardly write his own name.

Although in the portions of the proceedings of the Commission which we have quoted from, painting is the art chiefly referred to, it is easy to deduce from the arguments some which may elucidate the question of education in architecture. Not only good drawing-master's drawing, but the drawing of plans, elevations, and sections, and descriptive geometry, should be taught in ordinary schools. Every person should understand something of the language of geometrical drawings, though not using it in the manner of a professional architect. The notion of excluding a Claude in one art, must not prevent our setting forth that a certain preparatory education in languages and science, is necessary to the formation of the highest rank of the profession of architecture. Having brought the youth to the age,—or better perhaps, something over the age, at which he now generally enters an architect's office, the question is, (but which we do not propose to discuss here at length,) is the office, or some institute or academy, to be mainly looked to for the formation of the future architect. Already, with the facilities afforded at the London University or King's College, and by the classes at South Kensington, not to mention the arrangements of some classes in the Architectural Association, a good commencement may be made on the programme of the Institute of British Architects, itself a valuable thing as showing the requirements of the education. At some period or other, however, the student must place himself where he can learn the business of an architect, if not also, and to the end that he may possess certain abilities that will serve him as an architect and artist, where he can learn the qualifications of measuring surveyors. We should not regret to see his serviceableness, rather than his ability to pay a premium, made the inducement to the commencement of the connexion of master and pupil; a relationship which also we could desire to see more intimate, and longer subsisting, than it generally is. If the *atelier* system, and the combination of the labour of master and pupil, be desirable for the pupil, and necessary to the production of great works in painting, as even Mr. Ruskin admits, this is exactly the system which we would desire to see in operation for architecture. The present system of articled-clerkship fills the profession; but it is questionable how far it produces architects with the qualifications which the public and the art demand, or how far the supply is not forced beyond what would be created by the demand of the number of buildings to be erected. The class of pictures which are produced by young painters, and are sold in the exhibitions, —so that the artists do not care to assist other men in larger works,—are, at least very many of them, works of legitimate art, and going to serve some object in their ultimate location; though the art may not be the highest, or the object one in which the public are concerned. But are not architects' competitions worse? The natural demand from buildings to be erected, and requiring in the opinion of their managers, professional supervision, and the demand for drawings, bear no relation to one another: an army of men is called into existence who never can find remunerative labour,—because out of a hundred stalls of pupils competing, only one office can have the execution of the building; and designs made to programmes and "instructions," or designs hurriedly executed, are produced rather than duly studied works. It would be well to consider whether a system which not only induces young men to look to the profession, and architects to take them as pupils, in greater numbers than the actual demand for architecture justifies, but which induces a severance of the connexion of master and pupil at first moment that the young architect thinks himself justified in writing up his name, is the best for the interests of any kind. We have always thought that the system which prevails in the civil engineer's profession, might with great advantage to art and to young architects, be followed in our branch of the profession. This system, of a staff of engineers,—engineer in chief, assistant and resident engineers,—is precisely the system upon which the great work in the École des Beaux Arts was produced by Delaroche and by Mr. Armitage and his friends, and the system on which the *loggie* of the Vatican were decorated by Raffaelle, and his assistants,

* See pp. 804 and 854.

great artists whose names are known. Mr. Ruskin, after saying that "in all mighty work" "every touch and hue" has "been put on lovingly by the painter's own hand, not leaving to a pupil so much as to paint a pebble under a horse's foot," is compelled to admit that "when a thing was to be done in a certain time it could only be done by bringing in aid," the aid of pupils who "were nearly as mighty as the masters," but who were "so modest and simple, that they were repeatedly sacrificing themselves to the interests of their religion or of the society they were working for;" and that "assuredly" pupils should be so trained as to be capable of assisting masters in great works. Unfortunately, now, for the prevalence of such a system in our profession, not a clerk of works or pupil can be entrusted with the least contrivance, or builder asked his opinion, but the delegation or demand is set down to the score of inability or ignorance in the principal; so, the evil of first deviating from the right course,—that of allowing fair credit for each subordinate duty, and accepting none but what is due,—tends to be infinitely reproduced.

There is a question closely connected with this one, which received much attention from the Commission, namely, that of adding what is termed a lay element to the Academy. The architect cannot help having as his judges, those who are his employers. Great variety of opinion prevailed on the question before the Commission. As the Report says, many members of the Academy, with Sir Charles Eastlake, stated strong objections to associating non-artists with artists in deciding any question of art. The evidence of Dr. Storrar, one of the Council established pursuant to "the Medical Practitioners' Act," showed that the element originally intended in this council had not been introduced, but gave some noteworthy arguments in its favour. Dr. Storrar said:—

"I could perfectly understand any one, myself, for instance, a professional man, taking up a principle that might seem to be a very obvious one to a professional mind, but having to explain it from the beginning to the satisfaction of a non-professional mind, I might discover, in the very process of explanation, that the principle would not hold water, and give it up myself."

Evidence was given by others as to a lay element in the Institute of British Architects. We only say, that not only are buildings erected for the service of the public, but art-architectural must be designed for the same constituency. On the educational question, Dr. Storrar replied pertinently to the issue, as where he said:—

"I cannot help thinking that it would be a desirable thing if the Academy could secure some such test of mental culture as has been recognized by the heads of other professions. . . . . Leonardo da Vinci was not a worse painter because he had a very cultivated mind; and if we had more painters of cultivated minds we might, perhaps, have a better chance of having more Leonardos."

We have made no effort to discover and explain by what precise arrangement between the representative body of architects and the Academy, a proper system of architectural education could be instituted. But we cannot conclude this notice,—lengthy for our space, but inadequate for the treatment of many of the subjects discussed in the Commission,—without some further reference to the views of one witness in particular. Mr. Fergusson's impression is that it would be better that the connexion between the Academy and architecture were dissolved, and the whole strength of architecture "thrown into the institution specially devoted to that branch of art;" and he gives his view of the distinction between painting and sculpture on the one hand, and architecture on the other. Mr. Fergusson holds (answer to Lord Hardinge, question 3454), that architecture has no connexion with his *phonetic* arts, painting and sculpture, and that it is "a mere constructive art treated ornamentally, in the same way as you would treat pottery, jewellery [why he classes jewellery with architecture, rather than with sculpture, we cannot see], furniture and embroidery," all those arts being "capable of being made fine arts as well as architecture," but "none of those arts" having "any connexion with painting and sculpture, which are the embodiment of ideas that can be represented in words." Asked (3455) as to a connexion between painting and architecture, as in the decoration of an interior, he replies,—

"You may ornament your building either by paintings hung in frames, or paintings put upon the wall, or by ornamentation upon the ceiling and mouldings; but all those appear to me to be secondary parts, and not essential parts of architecture at all."

We cannot accord that those things that are not moveable, do not belong to our art. Surely ornamentation upon mouldings is part of architecture.

Mr. Fergusson demurs to the opinion that there are certain laws, as of proportion and variety, governing both painting and architecture, or does "not perceive them;" though we agree with him as to errors having been made by the painter-architects Michelangelo and others, and as to the distinction between the architect's works which are merely *represented* by drawings, and works as those of the painter, which can be exhibited in themselves. If "the whole influence of the architectural profession" cannot be "thrown into the Institute," and that body be not made what he hopes for, he admits it "would be very unwise of the architectural profession to throw away any shade of influence which they may obtain through the Academy." But after widening the basis of the Academy and introducing the non-professional element, he still thinks "that the architects are so different in their professional studies and in their professional pursuits from painters and sculptors, that they ought to be independent of them." He is however right in saying that "architectural education can only be properly given by men who are devoted to the profession," &c. The Report of 1856 (Appendix No. 20) by two architect-academicians of the time, appears to have been the result of the same view in the Academy itself. In questions 3492 to 3499 inclusive, Mr. Fergusson was pressed hard on the point of a natural federation in fine art, but he would not even admit a connexion between "sculpture properly so called and architecture." He said:—

"There is a class of sculpture which you may call decorative sculpture, which belongs to architecture, but which is certainly not sculpture of the high class of art which we generally understand by sculpture, namely, ideal sculpture."

He may be correct as to fact, where afterwards not thinking that any sculptor of the first class is employed in certain works of a decorative character that were referred to; but we apprehend that the sculptors are mistaken in not giving attention to works of the kind. The truth cannot be got rid of, that groups in pediments, relievoes, and even combinations of animals and foliage, are sculpture; and if the professors of high art sculpture hold themselves aloof from architectural decoration, they simply continue the blunder they have lately made to their own detriment, and to the shortcoming of architecture, general art, and "public monuments." But Mr. Fergusson thinks the two arts were dissociated in the Greek temples. Questioned as to the Elgin marbles, he replies, to our great surprise,—"They were not parts of the architecture, they were added to the architecture." Pressed with the question (3497) whether they were not "part and parcel of the building, and one of the most important features in it," he replies:—

"They were, but they are quite as good without the architecture, and quite as admirable. They were done by a different class of men, and with a different aim entirely."

Forgetting, as it seems to us, that the point of the question was, whether the *architecture* would have been "as admirable" without the sculpture, which surely Mr. Fergusson would say it would not have been. He thinks, however, that the arts were as separate,—that "the architect provided a place for the sculpture, but the sculptor had the whole control of what belonged to his art."

The intimate association of architecture and sculpture concerns the effect of our "public statues" and memorials, and our buildings. The arguments for it were alluded to in our last article; and we have frequently given them when treating the subject of public memorials. Mr. Tite, in his evidence (2596), spoke of the defects of pedestals resulting from this want of association, and of the better results in France from the system there.

We must repeat the expression of our surprise and dissatisfaction, that, after the receipt of much evidence on the subject of the position of architecture in the Academy, and whilst reporting the defects of our public works, the Commission should have left unnoticed the amendment of the system, through attention to the present claims of architects, and the training of architects in the future.

THE ROYAL ACADEMY MEDALS.

On Thursday, the 10th inst., being the ninety-fifth anniversary of the foundation of the Royal Academy, a general assembly of the Academicians was held for the biennial distribution of premiums, the president, Sir Charles Lock Eastlake, in the chair. Speaking first of architecture,—

A Travelling Studentship for one year, with an allowance of 100*l.*, was awarded to Thomas Henry Watson, "for the best design in architecture."

The subject was a town hall, style Gothic, more foreign than English: an excellent set of drawings.

The gold medal, books, and a scholarship of 25*l.* for two years, were awarded to Richard Phené Spiers, "for the best architectural design." Mr. Spiers also received the silver medal and books, for the best figured drawing of St. Stephen's, Walbrook. The subject of the original design was a Vestibule and Staircase to a Royal Palace. The plan was well studied, the design good, and the whole was set forth in some excellent drawings.

The following premiums were also awarded:—

The Gold Medal, Books, and a Scholarship of 25*l.* for two years, to Francis Holl, for the best historical painting; and to Henry Bursill, for the best historical group in sculpture.

The Turner Gold Medal to Frank Walton, for the best English landscape.

Silver Medals and Books were likewise awarded to Arthur Ackland Hunt, for the best painting from the life; to George Smith, for a copy made in the school of painting; to Arthur Ackland Hunt, for the best drawing from the life; to Francis Holl for the next best drawing from the life; to Edward Evans, for the next best drawing from the life; to John Barclay Grahame, for the best drawing from the antique; to Augustus E. Mulready, for the next best drawing from the antique; to Charles B. Barber, for the next best drawing from the antique; to Samuel B. Long, for the best model from the antique; and to Frederick S. Potter, for the next best model from the antique.

The president in his address said that the architectural drawings and the drawings from the antique were marked by an unusual degree of excellence on the present occasion. We fully agree with him.

FAILURE OF THE FLOOR OF THE NEW MARKET HALL, DARLINGTON.

Last week, this new hall, which has been in course of erection for the past two years, under the superintendence of Mr. Waterhouse, architect, was opened for the purpose of holding the annual fat cattle show. On Thursday, soon after the commencement of "shilling time," a portion of the floor suddenly gave way, and nine or ten men, together with three of the enormous prize animals, were precipitated into the basement, a depth of about 12 feet. Although, wonderful to relate, the animals were uninjured, such was not the case, we regret to say, with the spectators, one of whom was so much injured that he died on Saturday last, and others at that time were lying in a precarious state.

According to the evidence given at the inquest, held on Monday, it appears that the space which gave way was a compartment of the floor, 20 feet by 15 feet. A cast-iron girder ran lengthwise of this space, carrying the haunches of two arches, 20 feet by 7 feet 6 inches each. The girder at the middle was of the reversed ⊥ section, 15 inches in height and 1 inch thick; the bottom flange 9 inches wide, 1¼ inch thick, and the top 4½ inches wide, calculated, by the average of witnesses, to bear in the middle about eighteen tons stationary load if of the best iron, and if a perfect casting having proper hold at the ends. It appears, however, that it was *not* of good iron, had a piece of ash in the lower flange, and had only 3 *inches* hold at each end, which circumstances, in the opinion of the professional witnesses, reduced its strength by about a third—or to about twelve tons breaking weight of stationary load in the middle, though of movable load the witnesses variously estimated the amount it ought to have been tried with at from four to six tons in the middle.

The weight upon the girder at the time it broke was about fifteen tons equally distributed, about five tons being movable load transferring its momentum to the dead weight of arches, &c.; and with this weight it broke.

The most remarkable and culpable circumstance appears to us to be that, although the girders were cast within a quarter of a mile from the building, and for about two years there has been a clerk of works engaged to constantly inspect the works, *not one of the girders was tested*, although cast iron is proverbially an uncertain material, and in this case, as in most, the lives of hundreds depended on its sufficiency. It was stated at the inquest that the rest of the floor will have to be strengthened by the introduction of intermediate pillars.

The jury found that Mr. Robson was killed by the giving way of the floor, and expressed their opinion that the girder was not strong enough for the weight put upon it.

Hexham.—It is proposed to erect a new corn market and townhall here.

THE VALUE OF METROPOLITAN SEWAGE.

SIR,—I see by the resolutions passed, and the speeches made, at several recent meetings of metropolitan ratepayers, that "the analysis of the metropolitan sewage made by Messrs. Hofmann and Witt," and Mr. Ellis's interpretation of the estimate of these gentlemen, are adopted as a basis of the expectations entertained of the great pecuniary benefit to accrue to the ratepayers from the utilization of the sewage. Mr. Ellis maintains, that the estimate of Messrs. Hofmann and Witt, of a little over 2d. per ton for the manurial value of the constituents in the metropolitan sewage, refers to the average of the normal sewage and the rainfall taken together. Accordingly, he takes 266,000,000 tons, the estimated annual amount, with rainfall, at 2d. per ton; and on the assumption of this rate of value, he holds out the pleasing assurance to the ratepayers, that their moiety of the profit arising from the adoption of his scheme of utilization would be "an annual sum of not less than 700,000*l*." I, on the contrary, have repeatedly maintained, that it is perfectly clear, from the Report of the Main Drainage referees, embodying that of Messrs. Hofmann and Witt, that their estimate of 17s. 7d. per 100 tons, or a little over 2d. per ton, refers to the normal sewage without rainfall; and, accordingly, in calculating the total annual value, they took into account only the amount of sewage, exclusive of rainfall, which may be stated, in round numbers, as averaging only about three-fifths of the total quantity inclusive of rainfall. I further maintain that, especially under the then existing conditions, it would have been absurd in the extreme to attempt to determine the average composition of the sewage by the analysis of samples of the essentially variable diluted sewage inclusive of rainfall, unless, indeed, of specimens taken almost the year round. But all my appeals to the public document itself have been met by Mr. Ellis, and some of the advocates of his scheme, by contradiction, by irrelevant quotations from it, by pretty direct accusation of falsehood, and by most unscrupulous and entirely unfounded imputations of unworthy and interested motive on my part in making the statements which it is alleged are untrue. I have thought it only due, therefore, both to the ratepayers, who are so much interested in the matter, and to myself, whose veracity and motive have been publicly called in question, to request statements for publication from the authors of the report. The following are copies of the letters which have been kindly furnished to me by Professor Hofmann, the surviving analyst, and by Captain Douglas Galton, and Mr. James Simpson, C.E., the surviving Main Drainage referees.

"On referring to the report made by the late Mr. H. M. Witt and myself to the Main Drainage referees in 1857, I find you are perfectly correct in stating that our estimate of 17s. 7d. for the manurial value of the constituents in 100 tons of the metropolitan sewage (equal to a little over 2d. per ton), is founded upon the analysis of samples of mean sewage taken from the Savoy-street sewer.

I also find that the amount of sewage which the samples in question were supposed to represent was, according to the information furnished to us by the referees, taken at 95,000,000 gallons per day, and their report (p. 14) shows that this was the estimated amount of the dry weather sewage.

Reckoning the total amount of the normal dry weather sewage, in accordance with the above information supplied by the referees, at 95,000,000 gallons per day, or 157,625,250 tons per annum, we arrived at 1,385,540*l.*, as the total annual value of the constituents of the metropolitan sewage. A. W. HOFMANN.

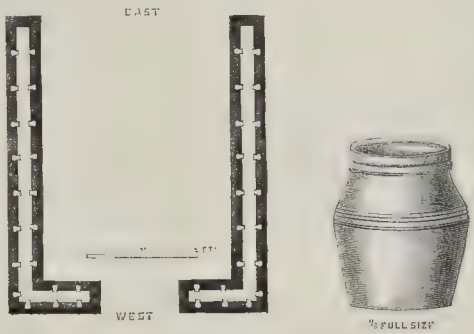
Dr. Gilbert, F.R.S., F.C.S."

"With reference to the question contained in your letter of 18th ult., we beg to state that the sample of sewage taken under our direction for analysis by Messrs. Hofmann and Witt, for the purposes of our report on the main drainage of the metropolis, were mean samples of *dry weather* sewage, taken from the Savoy-street sewer in the manner described in the report; and from the analysis of these samples, Messrs. Hofmann and Witt estimated the value of the constituents in the metropolitan sewage at 17s. 7d. per 100 tons, or about 2d. per ton. Their estimate refers, therefore, to normal sewage *without rainfall*.

DOUGLAS GALTON.
Dr. J. H. Gilbert." JAMES SIMPSON.

There is no doubt whatever, therefore, that Mr. Ellis has estimated the total sewage with rainfall, at the value per ton fixed by Messrs. Hofmann and Witt for the sewage without rainfall, and that he has thus, so far as the value is determinable on such data, overstated it by somewhat more than the amount which he informs the ratepayers will be placed at the disposal of the Board of Works for the reduction of local taxation over the metropolitan area provided his proposition for the utilization of the metropolitan sewage be accepted. J. H. GILBERT.

ACOUSTIC POTTERY.



As this subject is again exciting considerable interest, it would be as well to publish more generally than has yet been done the following curious discoveries, made in two of the churches in Norwich during the past few years.

In the year 1850, the floor of the chancel of St. Peter's Mancroft was removed, and immediately below it was found a drain about 1 foot wide and 18 inches deep, formed with rubble walls about a foot thick, and a concrete bottom, the inside being plastered over with a kind of rough-cast. This drain ran under the stalls, north and south, and returned at the west end of the chancel, inside where the screen formerly stood, stopping short at each side of the doorway (see plan); in fact, following exactly the usual arrangement of the choir seats. In both sides of these walls were built, about 3 feet apart from centre to centre, red earthen jars, with their mouths slightly projecting into the drain. These jars were 8 inches wide in the largest part, and 9½ inches high: at the mouth they measured 6 inches. They were perfectly clean and free from deposit, and inside were slightly glazed. They varied a little in shape; but the accompanying sketch from one still in the possession of Mr. Fitch, F.S.A., shows pretty nearly their general form.

In 1860 a precisely similar discovery was made in the chancel of St. Peter's Mountergate, in the same city; the only difference being, that here the jars had handles, and they were not opposite to each other, but alternated each side. The size of one of them in my possession is 9 inches high, and 7 inches in the widest part. Some of these were also partially glazed inside.

St. Peter's Mountergate being a much smaller church than St. Peter's Mancroft, the drain was not of the same extent, nor the number of jars so many; but otherwise the plan of the drain was exactly like that at St. Peter's—namely, running north and south, and returning with a short end to the west. In both churches the covering to the drain is only the old wood floor and joist. After careful personal observation, I have no doubt whatever but that these arrangements were intended to conduce to the chanting resounding more strongly; but whether it accomplished this or not is another matter. It would be exceedingly interesting to know if any similar discoveries, except those at Fountains Abbey, have been made in England. Perhaps some of your readers can give an account of like arrangements being found in other churches; and if so, I hope they will communicate to you the particulars.

MAKILWAINE PHIPSON.

Plan of Drain containing Jars, Church of St. Peter Mancroft.

THE SCIENCE OF SANITATION.

SANITARY science is simple in its requirements, but is complex in its combinations. Fresh air, pure water, wholesome food, and cleanliness are requisite to comfort and to health. But, when man is situate in crowded cities and towns, he is placed under conditions so numerous and so various that it becomes impossible briefly even to catalogue them.

Fresh air is said to be necessary to health. But how is "*fresh air*" to be secured in the midst of hundreds of thousands of coal-fire chimneys? Where is "*fresh air*" to be breathed in the midst of London November fogs? The reply must be,—"*Fresh air*" cannot be wholly secured to the inhabitants of great towns; that is, an atmosphere absolutely free from the gases of combustion and the gases of decomposition cannot be secured; but there are such things as a maximum of evils, and a minimum of evils. We may see a maximum of sanitary evils in a large town, like Liverpool, in past times, with its 50,000 poor persons existing in cellar dwellings, having the ceilings at or below the level of the adjoining street or ground surface;—or, like Liverpool at the present time, with its 3,173 close courts, containing 18,610 houses, and about 112,000 inhabitants; most of these places having common privies and cesspits crowded in the midst of the population. Of what avail are the hundreds of miles of sewers and drains, if liquid soil-refuse taints the subsoil below, and the atmosphere around; and if fresh air and sunshine are alike permanently excluded? Manchester and Liverpool have expended vast sums of money to bring in water, pure in quality and abundant in quantity; but we look in vain for any corresponding decrease in the local rates of sickness and mortality. We learn one practical lesson from this result, namely, that when it is asserted that to give a town an abundant supply of pure water will necessarily repress the local mortality, actual experience does not warrant the assertion. Some years ago Keswick and Whitehaven were each supplied with water in abundance, and in quality of almost absolute purity;—Keswick from springs on the clay slate shale of Skiddaw, and Whitehaven from the granites and clay slates bounding Lake Ennerdale. During the spring, summer, and autumn just passed and passing, these towns, so supplied with pure water, have suffered most severely from small-pox and from fever. In both towns the local authorities had, however, obstinately refused to sewer and drain; so that, in many cases, water became a curse rather than a blessing.

Sewers and drains are necessary to preserve the purity of the subsoil below, and the atmosphere around, dwelling-houses in towns. But a town may be sewered and drained to very little purpose,—nay, to a mischievous purpose,—if other sanitary arrangements are neglected; or, if the work is imperfect in design and bad in execution. Sewers and drains ought to transmit, at once, and continuously, all fluid and soil refuse passed into them. If, however, the fluid filters into the subsoil, and the solids deposit, accumulate, and ferment to corruption in the drains and sewers, and houses have direct communication with such drains and sewers, we need not wonder that, as Professor Christison asserted at Edinburgh recently, "There are fevers which sewers and drains do not prevent."* Before, however, we pronounce judgment against sewers and drains, all the facts should be known: as to their sectional form; as to their materials; as to their mode of connexion with houses; as to their ventilation; and as to their use and abuse. But sewers and drains, however

* Should he not have said,—"There are sewers and drains which do not prevent fevers?"

perfect, will not alone remove all causes of local sickness and excessive mortality. Waterclosets are means of great comfort and convenience in houses, when fixed in proper places, fully ventilated, and properly used. But, as fixed, and as used in many buildings, public and private, they only constitute a filthy nuisance. This is the case in some of the largest hotels in Scotland, where waterclosets have been placed on inner corridors, and against the inner walls of rooms, without light, other than artificial, and with no means of ventilation but into and through the interior atmosphere of the house.

Paris offers an example, on a grand and most costly scale, of blundering in sanitary science. In former times the city of Paris was, like many English towns to this day, a city of open cesspits, crowded in amongst dwelling-houses. About the year 1819, in an evil hour for the health of Paris, a municipal ordinance was passed, giving the civic authorities power to compel the abolition of open cesspits, and enforcing the construction of covered cesspools "hermetically sealed." An open cesspit is an abomination in a state of unceasing amelioration. The rain washes the filth and dilutes it, and the air and sunshine evaporate it; but a covered "hermetically sealed" cesspool is an unceasing generator of deadly gases of putrid fermentation, which gases traverse the pipes of house communication, and pervade, like a subtle scent, the whole dwelling and its precincts. Who has not recognized, in the gilded saloons and costly-furnished rooms of a Parisian hotel that subtle stench which open windows and open-doors do not remove? It is unseen, but palpable, almost to taste. This is the emanation from the underground and "hermetically sealed" Parisian cesspool. Paris may present all the external grandeur which architecture can accomplish; may be, as she is, "a city of palaces;" and may have that scrupulous cleanliness on the surface which we see; but so long as she remains a city of "hermetically-sealed cesspools" she will only resemble a whited sepulchre, fair without but rotten within; or be like that fruit, so beautiful to look upon, but so worthless because ashes to the taste at the core.

London was a city of cesspits and covered cesspools, or "*dumb-wells*;" but, fortunately for London, no imperial power ever "ordered" and "established" covered and "*hermetically sealed*" cesspools. Our municipal and local Dogberrys blundered into making street sewers, to remove surface-water from the channels, Swift's city showers, and nuisances of a similar character, by the valley lines to the river. At first, the drainage of waterclosets direct into the public sewers was prohibited; but the overflow from dumb-wells,—"*cesspools*"—was allowed, and then gradually, with the connivance of Dogberry, and, no doubt, in many cases, to accommodate his customers and friends, the rule to exclude waterclosets from public sewers was relaxed, and in time a new rule, admitting such uses, was established. We have sometimes wondered if Shakspeare intended to show, that with municipal freedom and municipal institutions, even ignorant and blundering clowns, like Dogberry, Verges, and the Watch, representing or caricaturing local self-government, could, in their own roundabout way, serve the purposes and ends of justice, as well, if not better, than a secret police under despotic rule. Nothing could be more complete than the results arising out of the action of Dogberry and his fellows. The offenders are brought to justice, vice is exposed, and innocence is made apparent and is established triumphantly. We are constrained to say, whilst laughing at the clown, "Well done, Dogberry."

London is at present undergoing a most costly experiment: vast "intercepting" sewers are being formed, at an expenditure of money amounting to millions sterling. Will these sewers improve the health of London or not? This is a question of the utmost importance to the ratepayers who will have to pay the cost. We have explained that a good supply of pure water to a town does not necessarily diminish the local rate of mortality; and we have also attempted to explain that sewers and drains may work mischief rather than good, if they are improperly constructed, badly or defectively ventilated, and retain the refuse passed in, so as to set up putridity and fermentation. The great intercepting sewers of London, if they only remove surplus water, may prove a curse rather than a blessing; as, at present, any excess of rain-fall in London produces surface mud; this surface mud is partially liquified and is washed down the street gullies and drains into the miles of sewers containing foul deposit; and so the surplus water and mud dilute, and, in a measure, disinfect the material deposited in the scores of miles of imperfect London sewers. By removing this water and mud from these secondary sewers, and so allowing putridity and fermentation to remain active, such districts as Chelsea, Belgravia, Eaton-square, Pimlico, Buckingham Palace, Westminster, Lambeth, and Bermondsey, may be injured rather than benefited. A grand work is not necessarily an improvement. The re-building of Paris adds to its external and visible magnificence, but leaves the festering sanitary cesspool sore scarcely touched. The grand intercepting sewers of the British metropolis will remove a volume of surplus water and mud, but will not necessarily benefit the sewerage of the metropolis at large. To complete the sewerage improvement of the metropolis, all the flat sewer inverts require to be re-constructed on the egg-shaped principle; all the sewers in ruins require to be re-constructed, and the thousands of street ventilators which now pass sewage gases direct from the sewer beneath to the atmosphere in the street above, should have side chambers and charcoal filters. The destiny of a nation is not settled by single actions, however grand. The reputation of a great man does not rest on one nor on two incidents in his life. There are the thousand and one minutiæ necessary to make up true greatness. The details, however numerous, must be in accord with the whole, before there can be true utility. There must be "*breadth*," "*harmony*," "*keeping*," to constitute true greatness. There must be "the power to rend the oak and to pick up the pin."

Sanitary science, as we have previously said, is simple, and is also most complex. The requirements are simple. Human arrangements are necessarily complex. There will never be complete, safe, and efficient self-acting arrangements and sanitary apparatus. Much must depend on human intelligence, and there must ever be unceasing care. A chronometer is the most perfect form of mechanism ever invented and manufactured, or "made," for marking time. We must not, however, trust the keeping and management of a chronometer to an uneducated boor. Sanitary works require knowledge to devise them, practical skill to execute them, and manipulative practical dexterity to work them.

Land drainage seems a very simple thing; but is, in reality, a complex and exact science. Water has to be permanently removed from the subsoil, and atmospheric air ought to be let in to the roots of the plants. The water may be removed in most cases: air is, however, admitted in very few cases indeed.

Town sewerage and house drainage also seem simple operations to some members of town councils and to members of local boards of health. But town sewerage and house drainage are necessarily complex operations. Sewers must be devised with knowledge, and must be executed with educated skill and care.

The drainage of houses has been, for the most part, executed at random; and even in London, to this day, with all the apparatus of the Metropolitan Local Management Act, and Metropolitan Board of Works at Spring-gardens, the duty of inspecting the proper construction of house-drains is left to builders and to chance. That is, notices must be given and sanctions must be obtained to break into a main sewer and to execute a junction with a house-drain; but it is not the duty of any metropolitan public officer to examine and see that such junction is properly made, and to certify the same to the legally constituted local authorities. Mr. Haywood most probably performs this duty for the City; but it has not been performed for the vast numbers of new houses recently erected at the west end of London. The surveyors to local boards of health in the country have this duty to attend to, and there is no reason why some person should not perform a similar duty for the several divisions of the metropolis.

With regard to sanitary science in house construction we moderns have made little progress. In some respects we have "advanced backwards." That is, the perfection of workmanship and of materials in modern houses is an evil. Flooring-boards are stove-dried, close jointed, and laid double; skirtings are of cement; door-casings, window-casings, and doors and windows are "the perfection of workmanship." The entire house, from basement to roof, is sound and air-tight in walls, in floors, in doors and windows, and in roof; but, and herein consists the evil, arrangements for ventilation there are none. The openings from the grates to the flues are low; the ceilings are high; but means for a never ceasing change of the internal atmosphere there are none. We have the most costly material and the perfection of workmanship spoiled in our house building, because we make no provision for permanent ventilation. Better, far, for health, the old houses of our great-grandfathers, with a chimney so wide that the family coach might have been hoisted up it; with a fire on the hearth so big that an ox might have been roasted at it; and with chinks, with cracks, and with openings, in floor, in walls, in doors, in windows, and in roofs, letting in streams of fresh air sufficient to drive a small windmill. Our great-grandfathers may have shortened their lives by gluttony and strong ale: they may have suffered from rheumatism; but they did not die prematurely of close rooms and foul air. Then consider our modern way of life, during "a season," "evenings at home, small and early," but crowded to excess. Then an ordinary ball or reception is something certainly to witness, to think over, to wonder at, and, after one dose, to avoid in future. We construct rooms, imperfect in ventilation, for five jets of light and a dozen people. But we light fifty jets, and cram in a hundred and fifty people, and then wonder at our own discomfort, at our friends' head-aches, and at the vast proportion of consumption amongst young people. A dinner-party in a modern dwelling-house is just as unsanitary, and in crowding nearly as bad. Houses ought to have special arrangements for ventilation to meet modern requirements of large parties: every door space should be made to open, on such occasions, up to the ceiling; and there should be means for full and free ventilation in corridors and staircases. But *crowded* parties are a barbarism, and ought to be avoided.

With respect to ventilation, who shall decide this question? Whose plan or whose patent shall be adopted? These questions are more easily asked than answered. Complex systems of ventilation do not answer for private houses. A certain fixed means by which there may be unceasing change in every room will be the best; and the more such means are confined to narrow, slit-like openings the better; a pure air-chamber behind a skirting, with a fine slit opening all round the room. An abstracting air-chamber behind the inner cornice, with a thin slit opening all round, leading to an ascending flue, will change the largest volume of air over the greatest sectional area, with the least perceptible draught. Square openings, such as Arnot's valves give, do a minimum of good, as they establish a current to the point of opening without necessarily changing the whole body of air in a room. Care must be taken not to draw in foul air through sinks, closets, and bath wash-out pipes, by leaving the pipes untrapped, and the plug out.

Sanitary science will not teach us to construct such enduring temples as we find remnants of in the ruins of Thebes, nor to rival the ancient Greek in Athenian purity of architecture, nor the Roman in the vastness and majestic grandeur of the Coliseum: but it will teach us how to provide, devise, construct, and regulate houses for the people in which there shall be so much of atmospheric purity as is necessary to health, and a chance to every individual born into the nation for an observance of Christian morality. We need not aspire to a restoration of Mediæval charity and monastic institution; that alone is true charity which enables a whole people to live and to die without almsgiving. Antiquaries and architects may mourn over the by-gone days of cathedrals; and the followers of Dr. Pusey may yearn after the "dim religious light," and sigh for "the fretted aisles," for the "sublime music" and the "imposing ceremonial," shrouded in all the pomp, in all the splendour, in all the colour, and in all the spirituality of sweet sounds. But that is not the religion of Christ which clothes its officiating priests in robes of scarlet and gold, and surrounds the gates and doors of its temples with wretched, squalid, human bodies, blind, maimed, scrofulous, and impotent from their birth by reason of contagious and festering disease ever present in their miserable dens of homes. The worshippers in the pure Christian faith will not necessarily go to that city, nor to this temple, but, in their own homes, will worship God in spirit and in truth. When sanitary science leads to these things, men will have learned a great secret, which will consist in those who govern securing the greatest amount of physical comfort and moral purity to the whole people.

The Prince Consort Memorial.—Mr. Scott's model of the memorial which is intended to be erected in Hyde Park to the memory of the late Prince Consort, has been submitted to her Majesty, at Windsor Castle. It is erected on a stand fitted for the purpose in the grand reception-room.

THE POOR IN BETHNAL GREEN.

SISTER SOPHIA LOIS, in charge of the Soup Kitchen, 1, Thomas-street, Brick-lane, says:—"I feel sure if the benevolent and wealthy witnessed the sad scenes which I daily meet with in my visits to the sick poor, they would cheerfully give their mite, remembering that 'he who giveth to the poor lendeth to the Lord.'" Our readers know the intense distress which exists in this district: this will be increased as the winter advances. The soup kitchen and other provisions will be sorely wanted; but it seems to us, and we have thought with much care on the subject, that in order to render effective service, some better plan of organization than that at present in use is required. We feel certain that if it were known that there is an influential committee, composed of a number of leading people of the district, clergymen and others, a considerable sum would be forthcoming for the supply of soup, coals, and other necessaries. We have already said so much in connexion with this matter, that we will not do more than again urge those who have local influence to lose no time in making the commencement of a relief fund, which may be the beginning of a means of aid proportionate to the extent of the necessity.

The Poor-Law Board have, through the Board of Guardians of Bethnal Green, passed a severe censure upon Mr. Christy, one of the relieving officers in connexion with the case of the late Caroline James. The Poor-Law Board, after some general mention of the particulars connected with this unfortunate death, say, "That it was evident that Mr. Christy had used coarse and improper language towards Caroline Palmer, one of the neighbours in attendance on the deceased, as he was leaving the house; and the Board have reason to believe that his conduct in other respects was not so temperate and forbearing as it ought to have been. The Board, however, are unable to arrive at the conclusion that the death of Caroline James was accelerated in any sensible degree by the course pursued by the relieving officer; and having regard for the fact that she was afterwards taken and maintained by her mother, and that her funeral expenses were afterwards paid by her brother and sister, they think that the circumstances of the case are not such as to require so extreme a step as that of requiring his resignation, especially when they take into consideration the length of Mr. Christy's services, and the deliberate opinion expressed by the guardians that in this instance there is great extenuation of his conduct." He may think himself let off easily.

THE PRESENT STATE OF THE LANCASHIRE DISTRICT.

THE position of affairs throughout Lancashire still presents a dreary aspect, and it is feared that to many the coming winter will be a time of much suffering. On this matter, Mr. Farnall reports that on the 5th instant there was a small increase of 228 in the twenty-seven unions in the cotton manufacturing districts, as compared with the number so relieved in the previous week. We do not think, however, that this increase is to be altogether attributed to cotton failure, for at this season of the year there are large numbers of persons connected with agriculture, building, &c., who fall out of work. If the weather should set in severe, there will be a large increase of pauperism, in both town and country, which will be in no way connected with the cotton trade.

In the above unions, since the 6th of December, 1862, there has been a total decrease in the number of persons receiving parochial relief of 143,050. Large as this reduction is, there were on the 5th instant 128,933 persons in those unions who were still depending on parochial relief. In the corresponding week of the year 1861, the number of persons who depended on aid from the parishes was 57,535; so that we have by comparison still an excess of pauperism to the extent of 71,398 persons.

Of this number Mr. Rawlinson reports that, provided the weather remain fine and open, by the New Year it would not be difficult to find employment on the public works for from 20,000 to 30,000 operatives; and as these will be for the most part men, a considerable reduction in the rate of pauperism may be looked for under favourable circumstances. Already fifty-two applications have been made for loans for public works, amounting to 721,605*l.* Of these proposed works, those which will require a sum of about 600,000*l.* to complete have been reported upon and sanctioned by the Poor Law Board. Applications have been made, in addition to the above, for loans amounting to 750,000*l.*, making in all 1,350,000*l.* to be spent on the making of roads, sewers, &c.

In considering this subject, it is of importance to know to what extent the peculiar unskilled labour of the cotton-spinners can be made available for these works.

ANCIENT STAINED GLASS.

GLOUCESTER CATHEDRAL.

AN account of the stained glass in the east window of Gloucester Cathedral has been published by Mr. Chas. Winston. At the commencement he says:—

"If it were possible for any one to suppose that Gothic architecture was indigenous of these northern regions, a glance at the windows of the earlier buildings in the style might suffice to undeceive him. The smallness and fewness of the openings, and deep colours of the glazing, are alike suggestive of a climate where a blazing sun exacts this homage to his power. The instinctive desire, under an obscure sky, for light, is exemplified by the increased size given to the windows as the architecture gradually became acclimatised, and by the diminution of their colouring. And after Gothic architecture, in its turn, was superseded by another exotic style, better suited to modern wants, a happy appreciation of the popular love of light characterises the works of the greatest of our national architects, Sir Christopher Wren. It is interesting to follow the progress of these changes, and observe their relation to each other, in the Mediæval styles of architecture and glass painting. In the Norman style, and in the earlier part of the Early English, whenever the use of much white glass occurs, it should be regarded as a submission to dire necessity. But the employment of white glass in large quantity, as a matter of choice, is observable in the latter part of the Early English period; and it continued throughout the Decorated in an increasing ratio to the coloured. With the Perpendicular style,—the style of architecture which we in England associate with the idea of 'walls of glass,'—occurred a remarkable change in the glass manufacture. The coloured glass was made less deep, and generally speaking more even in tint,—alterations absolutely necessary to suit it to the more finished mode of painting then adopted, and which culminated in the Cinque Cento; and white glass, whiter than before, was used in increasing profusion. The result is, of course, to occasion the transmission of a greater amount of light through the glazing. These changes were accompanied, at particular epochs, with remarkable alterations in the details of the design; peculiarities on which the antiquarian mainly relies as affording indications of date, and which are nearly, but not strictly, synchronous with changes in the corresponding details of the architecture,—the change in the architectural detail usually preceding by a few years that of the painted glass. A remarkable illustration of this fact is afforded by the great east window of Gloucester Cathedral, and its glazing. The stone framework of the window is an early but decided example of the Perpendicular style, and the painted glass is a pure example of the Decorated. So pure is it, indeed, that, but for the incontrovertible evidence of date afforded by the heraldry in the window, we should hesitate to proclaim it to be one of the latest instances of the Decorated style of glass painting. It presents no feature really indicative of the great change of style which was then imminent. Its material, its mode of execution, the use of 'smear shading,' the forms of the human features, especially of the eye and nose, all are such as any well-pronounced specimen of the style exhibits. The general design, too, of the glass painting, though in some respects novel, is in strict accordance with the rules of the Decorated style, and has no resemblance to a Perpendicular example except in the very large proportion which the white glass in it bears to the coloured."

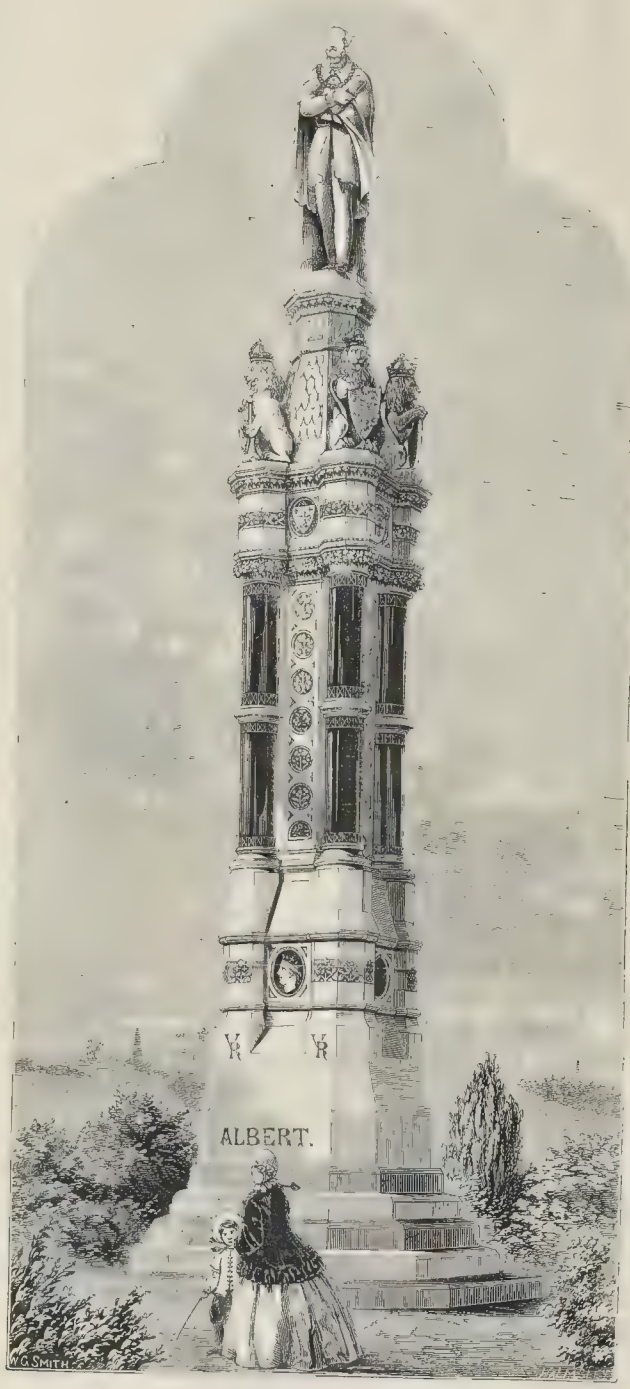
After a full description of the window, the writer says in conclusion:—

"Apart from the historical associations which attach to every ancient work, and pre-eminently to the present, it may be doubted whether the Gloucester window does not owe most of its popularity to the fine tone and rich hue of its glass. It would be impossible to meet with white glass that is more solid and silvery in effect. The red is beautifully varied, and is most luminous even in its deepest parts; and the tone of the blue can hardly be surpassed. It must also be admitted that the general design, through the size and simplicity of its parts, is calculated to produce a good and distinct effect at a distance, and that the execution of the painting, rough and imperfect though it be, is, on account of its crispness and boldness, well adapted to the nature of glass, so potent of its kind. But here our admiration should stop. Like all other Mediæval works in painted glass, the present is open to the gravest criticism. The figures are ill-drawn, ungraceful, and insipid. The shading, though sufficient both in depth and quantity, if handled with skill, to have produced a due effect of relief—an effect which obviously had been aimed at,—is so inartificially employed as to be useful only so far as it serves to impart tone and richness to the composition, and by contrast to increase its brilliancy. Every part of the figure, and all the members of the shrinework, seem to be equally in the same plane, though the real depth of the design, as shown by the lines of the drawing, and the very nature of the composition, is considerable. Whatever general distinctness of effect it possesses is due to the completeness with which the simple forms of the white figures and canopies are cut out and insulated by the coloured grounds—an achievement of no great difficulty. I make these remarks, not in a spirit of disparagement—the work was a great one in the uncritical times in which it was executed—but in the hope, if possible, of arousing attention to the lowness of the standard to which we, the more enlightened inhabitants of the nineteenth century, are labouring to conform in our church decorations,—a circumstance which would be utterly inexplicable did not experience show that a fashion, in every age, has never been the least omnipotent on account of its absurdity, or even ugliness."

GATEWAY, ST. GILES'S-IN-THE-FIELDS.

MORE than one correspondent has drawn our attention to the circumstance that what they term the "carving in stone" of "The Resurrection," in the churchyard gateway of St. Giles's-in-the-Fields, has been taken down, and that it ought not to be allowed to disappear. The carving is in fact in wood; and we are informed that the gateway containing it has been taken down with a view to widening the roadway here, and will doubtless be re-erected shortly. It was quite right to speak in time.

THE VAULTED CEILING OF ST. GEORGE'S HALL, LIVERPOOL.*



DEAR SIR,—The gist of the long and somewhat angry letter from Mr. Rawlinson, which you inserted in your last *Builder*, first appeared (so far as I know), in a Liverpool paper called the *Post*, on the 1st of December: I replied, therefore, in the same journal, and the editor did me the favour to insert my communication on Saturday last. To that paper I must, therefore, refer Mr. Rawlinson, and such of your readers as may be interested in this matter, for I really cannot ask you to insert so long a communication. I may, however, say that my only object in the remarks I made at the Institute was to contradict a statement I read in a Liverpool paper in October last, that Mr. Rawlinson had succeeded Mr. Elmes as architect of St. George's Hall, and to assert for my deceased friends, Messrs. Elmes and Cockerell, the credit of being the sole architects of that magnificent building. I intended no "sneer" at Mr. Rawlinson when I attributed to him the position of clerk of the works. I saw him at the building apparently performing such duties, but as he has since greatly advanced himself, it is the more creditable to him to have attained his present position from comparatively humble beginnings.

With reference to the brick roof of the merit was in the suggestion; but I learn from a friend at Liverpool, by a letter this morning, that subsequently to my conversation with Mr. Cockerell, and my pointing out the brick roof of the Jesuits' church at Munich, Mr. Elmes visited that city, and examined that roof with great minuteness; and that on his return he included it in his design, and added the cost to his estimates. I do not suppose any architect would imagine any great difficulty in its execution even with ordinary bricks, and the demands of Dr. Reid would, in my judgment, increase its stability, and facilitate its execution.

W. TITE.

December 10.

* This communication reached us on Thursday in last week too late for insertion. We hope it will be unnecessary to pursue the matter farther.

THE ALBERT MEMORIAL; ABINGDON, BERKS.

MR. JOHN GIBBS, ARCHITECT.

THE ABINGDON ALBERT MEMORIAL.

The first stone of this memorial of the late Prince Consort was laid on the 22nd of October last. The accompanying engraving represents it. The chief features, it will be seen, are medallions of the Queen on the base; four columns of Mansfield stone, surmounted by sculptured capitals; above, are the arms of the county, diocese, &c., emblazoned; and at the summit a carved pedestal supporting a full-length figure of the lamented Prince. The cost will be about 300*l.*, a considerable part of which, by the exertions of the mayor and other leading inhabitants, has been raised in the town and neighbourhood. The site chosen for the monument is the Recreation-ground, just outside the town, which was opened about twelve months ago for the benefit of the inhabitants, under the new *régime* of Christ's Hospital. The trustees readily gave permission for its erection.

The stone laid bore the following inscription:—

"A.D., 1863. Laid by R. Badcock, Mayor. John Gibbs Architect. Charles Selby, Builder."

A bottle was deposited therein, containing a new florin, shilling, sixpence, penny, and half-penny, and the following record inscribed on parchment, to which numerous signatures were attached:—

"The first stone of the Memorial in course of erection on this spot, was laid by the Mayor of Abingdon, Richard Badcock, in the presence of many loyal witnesses; which Memorial is intended to perpetuate to future generations the illustrious name of his late Royal Highness Prince Albert Francis Augustus Charles Emanuel of Saxe Coburg and Gotha, K.G., Chancellor of the University of Cambridge, and Consort to her Majesty Victoria Queen of England, A.D. 1863, October 22. By universal consent, he will henceforth be known by the exalted title of Albert the Good. The nation, proud of his name, everywhere offers its sympathy to our beloved but bereaved Queen, the mother of peace and love. He was the Patron Prince of all that is noble, useful, beautiful, and true. Learned, wise, and therefore good, he could well hope for other than an earthly crown, even a celestial one in the Paradise of Heaven."

LORD JERVISWOODE ON THE PROVISION OF DWELLINGS.

ARCHITECTURAL INSTITUTE OF SCOTLAND.

In his opening address, Lord Jerviswoode spoke of houses for the working classes. He said—I venture to suggest a scheme so that the greatest of modern inventions for forwarding locomotion should contribute even more directly than at present to the increase of the comfort of our city populations. The plan is no mere creation of imagination. I have seen it in practical operation. I happened to reside for a short time, a few years ago, in the neighbourhood of one of the greatest slate quarries in Wales, the produce of which was carried to places where it is shipped by means of a railway, and I was surprised and pleased to see this railway used constantly as the means of conveying the hundreds—I might, I believe, say thousands—of men employed in the slateworks to and from their respective homes, which might be seen on the hill sides, bordering the line of railway for many miles, and remarkable for their joyous brightness of aspect, neat dwelling-houses, tidy gardens, and bits of arable ground. It was impossible to avoid the thought that no cause could exist why such a system should be confined to one locality; or, on the contrary, that it might be applied, subject to modification in details, to other populous places; and if so, what changes might be wrought on the health, the habits, ay, and the morals of the people! Born and bred in the midst of a happy and com-

COTTAGE HOMES IN BUCKINGHAMSHIRE.*

paratively comfortable rural population, I have yearned at heart over the miseries of many of the poorer classes of our cities; and it is impossible to practise or to sit, as I have been called on to do, in our criminal courts, without feeling that the question of questions amongst us, and that in reference to which our responsibilities as a Christian people are the heaviest, is what is to be done to lighten the weight which presses so hard on the moral energies of our working classes? I have pondered over the subject, and the more I have thought of it the more have I been drawn to the conviction that apart, of course, from moral and religious agencies, to treat of which is beyond my present object,—the remedy, as respects the grievance with which alone I am dealing, lies in scattering our people over a greater space of ground, and bringing them to the places where they have their employments by means of railways and locomotive or similar power. I believe villages might be built within a few miles of such a town as Edinburgh, having their streets partly occupied by a single line of railway, the train of which would pick up its passengers at their doors, and set them down as near to the scenes of their labours as they now are when scattered through the town itself. I admit that a great practical difficulty attends this scheme, which is to satisfy proprietors that the erection of such villages would be remunerative. Unless they could be made so, I should despair of ultimate success. You are told, with much truth, that in these days masses of the labouring population are here to-day and away to-morrow, and that there is a consequent want of security for due payment of rent, which thus leads to its enhancement. Here, I think, we should be at fault, unless the Legislature should lend its aid; and, although I am far from thinking it the duty of Parliament to interfere on light grounds in matters of social economy, I hold it equally unsound to maintain that it should never interfere at all; and I think it possible that, in this case, well-considered interference might be practicable and beneficial. I would suggest that a scheme should be formed, under which it should be provided that a portion of the earnings of the labourer might, with his own consent and by agreement with his employer, be legally secured in the hands of the latter for payment of the rent of the premises let to the labourer. In this way an owner of house property would not be obliged to adopt those expensive, doubtful, and troublesome means to secure his rents which are now so common. I see nothing in it of which our labouring classes themselves need entertain a jealousy, as I would propose nothing beyond an arrangement optional to the parties, on the efficient working of which, in its details, legislative powers should be brought to bear.

VAULTING AND GROINING.

THE ARCHITECTURAL ASSOCIATION.

THE usual meeting of members was held on Friday evening, the 11th inst., at the House in Conduit-street.

Mr. R. Phené Spiers, V.P., in the chair.

The following gentlemen were, on ballot, elected members of the Association:—

Mr. Clement Dowling, Ballam-hill; Mr. John Davison, 5, Edgware-road; Mr. R. G. Benson, 10, Regent's Park-terrace; Mr. H. Clark, 39, Great James-street, Bedford-row; Mr. W. A. Mackness, 12, Queen's-road, Bayswater; Mr. G. M. M'Clollock, 2, South Bank-terrace, Kensington; Mr. Charles Hanbury, 27, Sackville-street; Mr. A. C. Booth, 12, Clement's-lane; Mr. J. S. Little, 12, Duchess-street; Mr. H. Williams, 52, Old Broad-street; Mr. F. Williams, Gore-road, Stamford-hill.

Mr. C. H. F. Lewes announced a handsome donation of books from Mr. Parker, of Oxford, accompanied by a letter containing his views as to the best course of reading in Gothic architecture.

Mr. A. Smith, and Mr. H. L. Florence, were, on ballot, elected members of the committee in the room of Messrs. Molecey & Paris, resigned.

Mr. R. R. Bayn then read his essay on vaulting and groining, for which a prize had been awarded. He commenced by stating that he quite agreed with the author of a paper already before the Association, "that on a thorough comprehension of the Gothic vault lay the whole gist of Gothic architecture." He (Mr. Bayn) proposed to deal with the subject solely with reference to ecclesiastical buildings, and briefly to glance at its history from the earliest known or attributed examples to its decay and final abandonment. Next, on the several modes of vaulting, domical, circular, and pointed, with a comparison of their relative merits (more particularly French and English), and then with reference to theoretical principles, and the rules by which stability might be insured. Having, with the aid of diagrams, illustrated and explained those portions of his subject, Mr. Bayn proceeded to observe that the Abbey Church of Westminster possessed some remarkably pure and beautiful specimens of vaulting. That of the chapels round the apse was particularly good; also the vaulting of the nave and the bay in the east cloister at the entrance to the chapter-house. The latter were quadripartite in arrangement with two secondary ogive ribs. With regard to the theoretical principle, and to what extent it was possible to decide by rule, so as to insure stability, he observed that the construction of an arch was one of the most important and curious operations in the science of architecture. It enabled the architect to cover spaces which he otherwise could not have accomplished with the materials of which arches are composed, and it enabled him to set up something capable of bearing enormous weight and pressure. To the architects and builders of the Middle Ages we were indebted for some of the grandest examples of this peculiar feature. The skill exhibited in the construction of Mediæval buildings by our forefathers proved that they had a perfect knowledge of the materials they were using and of the best modes of construction. The first great consideration in vaulting was to make it stand, and the great obstacle to overcome was the thrusting force. In many Mediæval buildings flying buttresses were applied at those points where in a groined vault the greater part of the thrust was experienced. In other cases the point or points receiving the thrust were of themselves sufficient to counteract and balance it, and were loaded to an extent to secure the required equilibrium. In all cases there was evident knowledge of the forces dealt with, and the means used to overcome them. In Classic buildings the pressure was overcome by the immense thickness of the walls, and seldom by the use of buttresses. The tendency to overthrow or to thrust out resolved itself into the universal law that the force was represented by the mass or weight of materials in that force minus the friction of the materials on each other. It was evident, therefore, that if the opposing force, either in the shape of thick walls, buttresses, or heavily laden walls above the point of thrust, was the greater, the first force was overcome; and as in the opposing force the centre of gravity was within its base, and it had no tendency to move in the direction of the first force, stability ensued. The inquiry was often made whether a stone roof was a positive necessity to a church built in a true and pure Gothic spirit: generally speaking, it was agreed that it was not necessary. This opinion was probably formed from the examples of flat wooden-roofed Norman churches, as at Peterborough and elsewhere, and the many beautiful little parish churches throughout the country with open wooden roofs. He fancied, however, that it would be difficult to defend a timber roof against a stone vault, even if the former were on such a scale as that of Westminster Hall, though it must be readily admitted that such a span would be next to impossible in stone. The rare examples of modern stone roofs must be supposed to be attributed to the cost of such constructions, and to the disinclination, in a utilitarian age, to expend more on ornament than was barely necessary. He denied that stone roofs were disused because in modern days we did not know how to vault, or in fact because we had lost the secret. He contended that the only secret, if such it could be called, was a comprehension of the composition and resolution of forces. Admitting these to be understood, there was no secret, and there was nothing to find out, and no difficulty in vaulting over any space within reason. It was evident from existing examples of the barrel-vaulted churches of Southern France, of the eleventh and twelfth centuries, that except in the case of very large spans, flying buttresses were not absolutely necessary, and that large spaces could be covered over with a legitimate stone roof inside and out, with the use of a circular or pointed barrel vault, cut up into bays by means of cross arches. A plain stone roof of this description would, in his opinion, be a greater architectural achievement than a timber roof, however rich it might be. But even if the propriety of abolishing stone roofs for nave spaces were conceded, he saw no reason why they should not be used in aisles and crossings. When at Ravenna, he found a beautiful example of vaulting with light materials, and he saw no reason why bricks might not be used for vaulting purposes, so as to combine lightness with strength. The resort to anything like tricks in adapting groining to modern wants, such as banding it with iron, or building-in iron to aid the constructive or suspending part, was, in his opinion, too contemptible for comment. All who had studied ancient examples of church architecture, and contrasted them with our cold stereotyped modern buildings, would, he thought, attribute much of the falling-off apparent in the latter to the absence of groining. As, however, we could not alter the age, and bring back again the spirit that produced such glorious examples of church architecture as those which were raised between the twelfth and fourteenth centuries; and as false effects were to be deprecated; he supposed the architects of the present day must remain contented to vault wherever they could; and this, he believed, might be effected economically, and at the same time truthfully.

Mr. Ridge called attention to a specimen of plain fan vaulting, which he said had lately been put up in Arundel-street by Messrs. W. & H. Smith.

Mr. Bayn questioned whether the example referred to was fan vaulting at all.

Mr. Ridge contended that it certainly was, according to the definition of Professor Willis.

The Chairman said, he quite agreed with Mr. Bayn, that the study of groining was of the utmost importance with a view to a correct knowledge of Gothic architecture. He apprehended, however, that it was greatly necessary that the student of the classic style should also master the art.

After some short discussion, which the lateness of the hour still further curtailed, a vote of thanks was passed to Mr. Bayn for his paper.

The Chairman announced, that the next drawing in the Class of Design would be "Entrance-gates," and that on the 17th of January a paper would be read by Mr. C. J. Adam, "On the Metropolitan Building Act."

OXFORD ARCHITECTURAL SOCIETY.

AT the last meeting of the term, held on December 9th, Professor Goldwin Smith was unanimously elected President.

The Rev. P. G. Medd read a paper, "On the Crypt of St. Gervais, at Rouen, and on some Churches in France." He spoke chiefly of Amiens, Chartres, Rheims, and Strasburg, concluding with an account of the crypt at Rouen, which he thought there was every reason to believe was as old as the third century, though the superstructure was not earlier than the eleventh century.

Mr. Tyssen, of Merton College, gave a summary of some of the most important items in the old churchwardens' account-books of St. Peter's-in-the-East.

Some drawings, by Mr. Buckler, of the paintings on the wall, which were found during the repairs in Headington Church, were exhibited. The chief subjects represented are the Nativity, Flight into Egypt, Massacre of the Innocents, &c. They were found in the south aisle, and their date is probably about the end of the thirteenth or beginning of the fourteenth century.

BRITISH ARCHÆOLOGICAL ASSOCIATION.

A MEETING was held December 9th, Mr. Godwin, V.P., in the chair.

The Chairman announced that the council had had the honour of enrolling his Grace the Lord Archbishop of York as a life associate and contributor to the "Collectanea Archæologica."

Mr. Clifford W. Chaplin, of the Oxford and Cambridge Club, and Mr. George Lane, of the Mess-room, St. James's Palace, were elected associates.

Mr. Gunston exhibited a portion of an iron buckler, with spike as an *umbo*, found at Dowgate-hill. The iron plate was studded with minute brass knobs.

Mr. Cuming exhibited the spike of a similar buckler from the Brocas collection at Wakefield Park, Berks.

Mr. Irvine exhibited an interesting brass lock of the time of Elizabeth. The key, a good piece of work, had a viscount's coronet and the letters B.M., presumed to be those of Brown, Viscount Montagu.

Mr. F. J. Baigent exhibited drawings of an interesting series of bosses in the vaulting beneath the tower of Winchester College, consisting of monograms and other devices with shields of arms, the whole of which Mr. Baigent had been suc-

cessful in reading. The drawings made of them are very good, and were executed during the recent rebuilding of the tower, when the bosses were all taken down. There are about twenty-six in number, and to these may be added a few others from the roof of the Fromand Chantry in the college cloisters, built only a few years before the tower. These drawings are to be engraved, accompanied with biographical notices, for the Association.

Mr. H. Godwin, F.S.A., exhibited a fine silver watch of the seventeenth century.

Mr. Irvine produced tracings of tiles from Whitland Abbey, South Wales; St. Nicholas's Church, Ludlow; Pershore Abbey; also from Dorchester, Oxon, and Westminster, which were referred for arrangement and further consideration.

Mr. Blashill exhibited and described some interesting Roman remains, found near St. Dunstan's in the East, especially a mass of concrete forming part of a tomb.

Various other exhibitions having been made and commented on,

Mr. Saxe Bannister, M.A., read a notice of two MS. lives of Henry V., unpublished, in the British Museum and Lambeth Libraries. He submitted fac-similes of the MSS., and read extracts relating to the king's prisoners and the second campaign in France, and his diplomacy; also to his political economy, in reforming the coin of his French conquest; and to some proceedings towards the Lollards and the Welsh people.

The Rev. E. Kell, F.S.A., gave an account of the finding of further Roman coins in the Isle of Wight.

Mr. E. Roberts, F.S.A., read a paper on Brixworth Church, Northamptonshire, and exhibited views and plans. This gave rise to an animated discussion; after which the Association was adjourned over Christmas, to January 13th, 1864.

TERRA-COTTA PORTICO, LONDON.

A PORTICO has been erected at Viscount Strangford's, in Cumberland-street, Hyde Park, in terra-cotta, by Mr. J. M. Blashfield, of Stamford, from designs by the late Mr. Augustus H. Morant and Mr. J. M. Lockyer. It consists of an entablature carried on three columns at each angle in front, and one column on each side against the front wall of the house. The columns are Corinthian, treated freely: they are of the same diameter throughout, and diapered on the face.

The terra-cotta of which this portico is composed is a kind of porcelain stoneware, being a compound of clay, flint, and other bodies, burnt to a heat at which soft iron will melt, so that partial vitrification of the particles composing the body takes place in the burning. The material is, therefore, affirmed to be indestructible by frost and the alkaline bodies in the London atmosphere, and more readily cleansed from soot and dirt than marble and stone.

The columns are made in parts, and united at the joints with dowels and blue lias cement. The entablature is composed of moulded bricks in the same material. In the cornice all the bricks work as headers, and are made to tail back 9 inches, the bricks varying in depth, width, and length, to suit the details of the work. The longest brick is about 19 inches.

The cost of this work, inclusive of the modelling, is less, we are informed, than it would have been if executed in ordinary brick and stucco. The bricks forming the architrave are made in section to fit a T-bar of galvanized iron, which passes through them and bonds the whole work together.

WESTMINSTER WORKING MEN'S CLUB.

THE third anniversary meeting was held on the 11th instant, Sir R. W. Carden in the chair.

The building has recently been enlarged by taking in an adjoining house, and re-modelled according to plans prepared by Mr. Downes, architect, the contractor being Mr. G. Richardson, of Sloane-street. There are now class-rooms, reading and lecture rooms, in addition to the social club-room, library, lavatory, &c. The cost, with the necessary fittings (of the plainest kind,—deal tables and forms with backs, &c.), is 580*l.*, towards which Miss Adeline Cooper, who does so much for the institution, still requires 190*l.*

All the affairs of the Club, as well as the various societies carried on there, are managed entirely by the men themselves, Miss Cooper acting as their treasurer, and advisor when required. We hear with pleasure that most admirable order has been maintained. There has not been one defaulter; and when the books were looked over (above 400) previously to packing them up for the building alterations, not one was missing. The secretary, librarian, and committee, chosen from the body of the members, all give their services gratuitously, the only person paid being the room-keeper, who resides on the premises. Coffee, ginger-beer, cake, and biscuit are supplied at cost price to members, and the Club is open every evening, including Sundays, that being the day of all others when the working man is most exposed to temptation. The institution is entirely unsectarian; the men converse freely on every topic, religious or political, with perfect good temper; and the better educated naturally improve those who have not had equal advantages.

The classes are free, and comprise reading, writing, and cyphering three times a week; a French class, a singing class, and a Bible class, with one hour's simple service on Sunday evenings. The Penny Bank has received as deposits 145*l.* since its commencement in 1861. The Loan Society has granted above 130 loans, representing above 250*l.*, although the capital is not more than 90*l.*, divided among forty-five members. The Sick Fund has given sums varying from 10s. to 20s., to fourteen sick members who had paid 1d. per week for thirteen weeks; and the Barrow Club has furnished ten barrows, of 50s. each, to as many members who are costermongers, and who, at the end of fifty weeks, at 1s. per week, will be the proprietors of their barrows, instead of paying 1s. or 1s. 3d. a week for the hire for years.

There are above 500 members of the Club, and we should be glad to hear of 500 such clubs.

ON CEMENTS.

THE following is a part of a communication signed "James Pulham:" we have not space for the remainder:—

It is a common practice with slow-setting cement, when a moulding is being run, or filled out, to lay some on the brick core, and allow it to get more or less set, and even crusted, according to the time it is left, sometimes till it becomes a crystalline surface; then the adhesion of the next stuff laid on is imperfect and unsound. It is the same with the plain face. As "Cautious" says, it should be finished off at once. Dirty sand is an evil, as the cement will not harden with it, and is crumbly. Some cements set too quickly, so that the workmen cannot use it properly while it is good, before it begins to set: then it is frequently killed,—that is, its hardening property is injured, especially when it is worked up again, and more water added, as is sometimes done. Then it is of very little good, and is crumbly indeed. Mouldings are often run out or finished with all cement, no sand in it, to make it easier and finer faced, which is sure to crack.

The cement is frequently laid on brickwork dry, or nearly so: then the moisture is absorbed before it can have time to set, and it will not harden. This is worse, too, when exposed to the heat of the sun or a drying wind: it will then dry before it can set, if it is slow-setting, as it should be; and if quick-setting, the injury done by drying it up directly is even more, and may generally be avoided by being sheltered from the sun for a week, and when cool it should be wetted frequently, to retard its drying quickly. I know that, with the haste with which much of it is done, it would be inconvenient, and will not pay at current prices, which have been reduced too low (especially by the common system of sub-letting), for the time to be devoted to it, and for the trouble that is necessary to insure durability; and this an employer should, if paid sufficiently, be able to give, and, if experienced, he can do it, as of course it had better not be done at all than done badly.

It is generally the best work that is done in the autumn and winter, if it escapes the frost a few days after it is done, as it then sets and hardens gradually; but cement should not be put on brickwork while the mortar is wet, as that causes cracks.

Portland cement has this great advantage over others, that it can, with good management, be worked in winter, while other cements cannot without great risk of the frost injuring them before they are dry. It is sometimes the case that, to hasten the setting when slow, more cement is added to make it set quicker, and will make it crack and burst.

It often happens, where brickwork is formed for a core to mouldings, that it is irregular, requiring the cement thick in one place and none scarcely in other parts. Where this is the case, it is better to have recourse to good Roman cement, to dub it out to within three-fourths of an inch with pieces of brick, rather than have great thicknesses of the Portland, as great thicknesses should be avoided, except where a greater proportion of sand or gravel can be used than in running a moulding. It is best to have uniformity of thickness; and the best way is to use a running mould in forming the brick core when building, though more trouble to the bricklayers. I have often had to put whole bricks on a brick core to fill it out; but a better method with top projections, which I adopt where I can, is to have a box-mould of wood, for instance, of the *cyma recta*, frequently forming the top: fix it up, and fill it in with the brick and cement. It is then one solid mass, such as is not possible by the piece-meal way of adding bit by bit. It is no more expense where great length is required.

But cheapness is too much the order of the day for all this trouble to be taken, at present prices, though more may be done for greater perfection, which should be our aim. Then its durability is certain; and, even as it is, there is much of it in far better condition than the stone most commonly used in buildings of late years.

COMPETITION.

Congleton Town-hall.—At a special meeting of the town council, "for the purpose of adopting and confirming the report of the Town-hall Committee with reference to the site of the new Town-hall, and as to the amount of premium to be given to the successful architect, and generally on the subject of the new Town-hall," the mayor stated that the committee had recommended that the old site be adopted for the new Town-hall; that a premium of 25*l.* be given to the architect tendering the best plan or design, and that the time of competition be extended from the 1st to the 18th January. The Town Clerk stated that upwards of 140 applications by architects had been received. Several architects had inquired whether the successful competitor for the plans and designs would be entrusted with the superintendence of the work. He (Mr. Moorhouse) had given no definite reply to this inquiry, inasmuch as it rested with the council. It was not unfrequently the case, that the plans and designs of one architect were entrusted to another to be carried out. Mr. Warrington suggested that the fund intended for the contemplated memorial to the late Mr. Bullock might be expended in the erection of a clock tower in connexion with the new Town-hall. The committee's report was adopted. Mr. Radley then observed that if the sum of 5,000*l.* was expended in the erection of the proposed building, some special contract should be made with reference to the architect's commission for superintending the work. The usual per centage on smaller sums was, he believed, something like five per cent., but in the case of a sum of money like the one proposed, it was customary to make some reduction in the commission. A short discussion ensued, during which it was mentioned that three or three and a half per cent. was the commission usually charged on large sums. A question was asked whether, if a sum of 250*l.* were paid to the architect for his commission, it would not include the salary of the clerk of the works. Some members thought it would, others thought it would not, and others thought it ought. The subject was ultimately allowed to stand over, Mr. Radley explaining that his object in mentioning it was, that there might be some delicacy in bringing it forward after an architect had been appointed. It is to be hoped that competitors will be warned in time, and insist on a proper understanding as to payment of the ordinary commission.

GAS.

THE Worcester Gas Company have resolved to reduce the price of gas to private consumers from 4*s.* 6*d.* to 4*s.* per 1,000 cubic feet. A reduction of the charge for the public lamps 5*s.* per lamp—that is, to 3*l.* 5*s.* per lamp per annum—has also been agreed to.——A contemporary states that a shopkeeper in Oxford-street is trying (what he erroneously calls) the French mode of lighting. The gas-burners are let into the ceiling above the windows, where they encircle small funnels. In fact, it is the application to shop windows of what has been called the "sun light." "There are no strong shadows, no dangerous wavering flames, no encumbrance of gaselier stems," says our authority. "The light is intense yet not dazzling, and, above all, it is equally

distributed. The ventilation is excellent, and safety and health are both secured. We believe [it is added] this excellent system of lighting originated at some theatre in Paris." This is a mistake. It originated at the Greenock theatre, in Scotland, upwards of twenty years since, as recorded in the *Builder* some years afterwards by Mr. John E. Dove, who suggested and applied it at Greenock. It *was*, some years since, also tried, we believe, in a Paris theatre; and the principle, that of lighting exclusively from above, was even adopted, on one occasion, together with the electric light, in her Majesty's Theatre, Haymarket. The "sun-light" system, however, is now well known, as a favourite mode of lighting churches and halls in this country.——A letter from Naples has the subjoined:—"Gas-pipes are now being laid down in the streets of this city. Hitherto, all the streets except three or four had been badly lighted with oil. It is a French company which has undertaken this task. The gasometer, built near the railway station, is, in the opinion of competent men, a masterpiece in its way. It was solemnly inaugurated in the presence of the hereditary prince, the prefect, and the syndic, a few days ago, and a dinner was given on the occasion to all the workmen."

ANNUAL REPORT OF METROPOLITAN BOARD OF WORKS.

AN elaborate "Report" for 1862-3, with "Account in Abstract," has been printed by authority of the Board by Messrs. Brickhill & Smith, of Newington Butts, Surrey. Much of the information given in the "Report" has already been brought before our readers at different times. The general summary of receipts and expenditure for the year shows the total receipts to have been 1,448,694*l.* 6s. 5d.; and the total expenditure 1,412,950*l.* 10s. 3d. The engineer's report states that "the total value of the Main Drainage contracts, either completed or in course of execution, is about two millions and three-quarters, involving the construction of upwards of sixty-five miles of main intercepting sewers, varying in size from 12 inches by 9 feet 6 inches to 3 feet by 2 feet; together with the pumping stations, reservoirs, storm and other outlets, overflow weirs, and numerous minor works in connexion therewith." He draws attention to the increased expenditure from rise in the value of materials and labour since 1860: that increase he estimates at upwards of 30 per cent. The cost of the portion of the works done within the present year amounts to 720,229*l.* for works alone extending to forty-five miles in length.

MORE DWELLINGS FOR THE WORKING CLASSES AT EDINBURGH.

LARGE additions have this year been made to the number of the dwellings for this class of citizens, especially at the west end. Considerable stir and bustle in building have prevailed during the whole summer, and at this late season the works are being pushed forward with great energy. At the Grove and Spittal street alone there are in progress upwards of twenty "lands" of houses, besides others in Fountainbridge, which will contribute nearly 200 dwelling-houses, with accommodation suitable for the industrious and working classes. These buildings have in the majority of cases sprung into existence by the co-operation of those who have experienced more or less inconvenience from the high rents and scarcity of dwellings suitable for them. Those erected by the Fountainbridge Church-Building Association, the Cricket Park Building Association, and the Grove Park Building Company, on the south side of Upper Grove-street, consist of six "lands" of four-story houses, now nearly ready for occupation. This block of buildings is situate on the south side of the Caledonian Railway, and commands a fine view of the Corstorphine hills and adjacent country. The fronts of the houses are of the plainest description, and have a somewhat rustic appearance, being built of a square, natural-faced rubble, the fronts of the doors and window-dressings being also of natural-faced stone, with the margins tooled. The access to the tenement is by common stairs, each house having bells and opening apparatus for the doors at the foot of the stairs. The houses are arranged in half-flats, and vary in their accommodation and cost. The cost of three-apartment houses averages about 135*l.*, and larger houses from 160*l.* to 195*l.* The plans were prepared by Messrs. Paterson & Shiells, architects; and the tenders received were all under the architects' probable estimate.——The annual general meeting of the shareholders of the Edinburgh Workmen's Houses Improvement Company (Limited) has been held. The report of the directors congratulated the shareholders on the satisfactory progress of the company. The Prince Albert Buildings, Dumbiedykes, consisting of 132 houses, are now completed, and have been partly occupied since Whit-Sunday last. The rents range between 9*l.* 10s., and 13*l.*, the majority being 10*l.* 10s. and 12*l.* 12s. Several of the houses have been sold at prices from 150*l.* to 185*l.* A dividend in the mean time of 2½ per cent. was recommended, and the report was adopted.

NEWS FROM SYDNEY, NEW SOUTH WALES.

THE temporary Post-office in Wynyard-square has been commenced. Increased accommodation has long been required at the old premises in George-street, and a plan for an entirely new building, retaining only the Doric peristyle, was prepared by the Colonial Architect, and approved of by the Government. The temporary building, which is very unpretentious in appearance, was ready for the galvanized roof by last despatches in September. It is about 200 feet in length, by 70 in width, and will have stables at the back for the telegraph department, as well as for the post-office. The contract has been taken by Mr. W. Harmer for the sum of 2,975*l.*, and is to be completed in three months. In the meantime tenders will be invited for the alterations at the old Post-office, in order that they may be commenced immediately upon the removal of the department to Wynyard-square.

The masonry for the new wing of the Australian Museum in Hyde Park was approaching completion at the date of our correspondent's letter: preparations were being made for the roofing.

The new wing of the Registry-office, in Elizabeth-street, was on the point of completion.

A contract had been taken by Mr. Gwyneth, for some extensive works on Spectacle Island, to cost about 7,000*l.* These will consist of a powder-magazine, quarters for a superintendent, quarters for soldiers and for labourers, a wharf, and a jetty.

The walls of the Australian Mutual Provident Society's new office were up to the height of 40 feet, the greater portion of the fluted columns of the upper story being fixed.

Various offices, stores, and houses for business firms and private residences were in progress.

The only large work that the city corporation were carrying out was a 6-feet oviform stone sewer, 390 feet in length, from Hay-street to the water-course where it crosses Elizabeth-street, forming a continuation of the stone tunnel carrying the sewer from the Haymarket to Darling Harbour. The sewer has been contracted for by Mr. Calder.

The seventh annual report of births, deaths, and marriages in the colony records the facts that in the year 1862, there were solemnized 3,326 marriages, that 15,434 children were born, and that 6,524 persons died. Hence it results that the natural increase of the population within the year, from the excess of births over deaths, and of course exclusive of immigration, numbered 8,910 souls.

The mean of six years shows that to every 1,000 persons living in the colony, 9 couples are married in a year, 42 children are born, and 17 persons die; or, one person in 54 is married, one child is born to every 24 persons, and in 58 persons of all ages one died.

France gives 26, Great Britain 34, births to each thousand, while New South Wales gives 42. In France the mortality is nearly 28 per thousand, in England 22, in Scotland 21, in New South Wales 17¼. Of 100,000 persons living in the respective countries, there are married in the colony in a year 184 more than in England, 237 more than in France, 497 more than in Scotland. To the same number living there are 792 births in New South Wales more than in Great Britain, and 1,568 more than in France; while the rate of mortality is below that of Scotland by 362, lower than that of England by 486, lower than that of France by 1,042.

In 1862 there were 33 children born out of wedlock to every 1,000 born in wedlock: the mean average for six years was 29. The proportion of illegitimate births in England, during the six years ended with 1860, averaged 65 per thousand; more than two to one of the average in the colony. In Scotland, last year, the illegitimate births were 95 per thousand,—nearly 10 per cent.

The prevailing diseases, as taken in August last, were those of the nervous and respiratory systems, which proved fatal in 50 per cent. of the aggregate number of deaths.

The infantile mortality was 45·00 per cent. of the total deaths.

THE FALL OF A HOUSE IN ISLINGTON.

ON Monday last the adjourned inquest on the bodies of the men killed by the fall of the Three Wheatsheaves public-house, Islington-green, was resumed before Dr. Lankester, the Coroner.

Mr. William Moseley, district surveyor for the western portion of Islington, was examined at some length. He said it was his duty to carry out the provisions of the Metropolitan Buildings Act by inspecting works in progress to see that they were built in such a manner as to prevent the spreading of fire, also that certain works were of a particular thickness and construction. The fall of the building took place from circumstances entirely beyond his control. He had made a report to the Metropolitan Board of Works on the subject, in which he stated that he was of opinion that the accident occurred from want of proper adhesion between the mortar and cement used in the construction of the building. He had seen nothing defective in the materials, and he therefore came to the conclusion that the accident happened from the too rapid heaping up of the brick-work, which he had no power to prevent. He could not say whether the piers gave way first or not, or whether they were sufficiently strong. As long as the Act was complied with he had no power to interfere with the construction of the walls and piers, even if built too slightly. If he had considered them to be too weak to bear the weight imposed on them he could only have interfered as a matter of common humanity. There were no special directions for the building of isolated piers. While the building was in progress he never saw nor had any reason to suppose that it was in any danger. Speaking only as an architect, he thought it a reckless thing for the builder to undertake to finish the building in so short a time. The primary cause of the falling of the building was the undue haste with which the work was carried forward. There must have been some secondary cause, such as the weight of the cornice, the undercutting of the piers, or the removal of the sheres, but he could not say which. He understood from his assistant that there was a cornice being put up. On the Saturday previous to the accident, on visiting the building, he thought the work was going on very rapidly, but not dangerously so. With regard to the bressummer he thought it of sufficient size, and placed in a proper position.

Edward Kemp, a mason employed in the building when it fell, stated that he was in the basement at the time. He had on that morning fixed the right and left doorsteps. There was no strut to the left doorway, but he removed one from the right door. He did not cut anything away from the right doorway, but he did from the left. There was a space left for the step, and it was the top of that he cut away to the depth of half an inch. The doorstep on the left was 5 feet 3 inches by 14 inches by 7 inches: the one on the right 5 feet 3 inches by 14 inches by 6 inches. The directions as to size were given by Mr. Chapman. Mr. Williams was there while he was fixing the first step, but he did not think it necessary to ask him whether he should cut away the brickwork or not, but did it on his own responsibility.

Mr. Williams, the architect concerned, said he had instructions, and it was his intention to see that the work was completed, as far as the roofing in and bar story went, by the 7th of December. Generally speaking the work was executed according to his directions, with the following exceptions:—The pier adjoining the Agricultural Hall was not carried up according to his drawings. The pier was built only half the size he had directed, but he could not say whether this deficiency produced the fall, but it might be one of the secondary causes alluded to by Mr. Moseley. He first discovered the discrepancy between the pier and the plan when the former was about 4 feet high. He thought it advisable to have it altered, and gave directions for its being pulled down and rebuilt the proper size into a chase in the wall. It was not until after the accident that had happened that he had discovered that those directions had not been complied with. The bressummer was not of the size indicated in the specifications, but the alterations were made by his (witness's) authority. He did not attach very much importance to the alteration of the pier, and omitted to see that it had been done. As to the bressummer, he repeated his opinion that it was placed in the best-position. The pier next the Agricultural Hall should have been 14 inches square and ten 7 inches into the wall, but it was built only 14 inches by 7 inches. The bressummer was cut 7 inches into the wall, but according to the Act it should have gone in only 2½ inches. If he had to build the same building again he should employ the same dimensions. The primary cause of the accident was want of cohesiveness in the mortar. In this and in other respects he agreed with Mr. Moseley as to the secondary causes of the fall. He did not think the bressummer had anything to do with the accident. A 4-inch step would have been preferable to a 7-inch step as no bricks need then have been cut away. He considered the cutting away detrimental. The specification stated that a 4-inch step was to be used, and there would have been no necessity to cut away the brickwork had it been made of the thickness specified. He did not think the weight of the cornice had anything to do with the matter. The accident, no doubt, occurred from a number of causes combined.

Mr. William Chapman, the contractor for the building, stated, in the course of his evidence, that he ordered the pier to be pulled down and rebuilt, and saw it commenced. Mr. Williams directed it to be chased, but only part was chased, the rest being toothed. He blamed the bricklayer for not chasing it as he had been told, at the same time he attached no importance to it. He felt certain that the fall of the building had nothing to do with the pier in question. He could not state positively the cause of the accident. He saw that the two piers were buckling, the left one more than the other, and immediately directed the carpenters to shore up the doorway. One cause of the accident was the buckling of the piers; but he could not account for their doing so. The materials and workmanship were excellent. No doubt, it would have been

better had the piers been of the same thickness behind as in front. The crack he saw was in the centre of the 9-inch reveal. As an experienced builder he considered that the bressummer was sufficiently supported by the Agricultural Hall wall, without any corner pier. There was no stram on the shore at the right end door: had the pier been weak there would have been a stram. He did not agree with the other witnesses that the dampness of the mortar was a primary cause of the accident. He rather thought the piers had more to do with it.

The witness was asked if he thought the piers were strong enough, and ultimately said that he did not think they were strong enough. He thought that going on with the building before the mortar was set was a hazardous operation.

The Coroner having summed up at some length, the jury retired to consider their verdict. After an absence of more than an hour they returned, and the foreman, addressing the Coroner, said that, although they were perfectly of accord as to the death of the men being accidental, there was a majority of 16 to 5 in favour of a resolution censuring the architect. He begged leave to say that he (the foreman) was in the minority.

The Coroner, in reply, said that both verdict and resolution would be recorded, the foreman signing the former, and the latter being signed by the sixteen who had agreed to it.

A verdict of "Death through an accident caused by the insufficiency of the central piers" was then recorded.

The resolution was to the effect that the piers having been built according to the plans and under the superintendence of Mr. Williams, the architect, the members of the jury signing it were of opinon that he deserved the severest censure.

The accident, as it seems to us, was led up to rather by the mode of construction and the improper weakening of the piers at the bottom, by the omission of two courses, and the further cutting away for the steps, than by their want of size. As was pointed out in our last, the bressummer did not carry the front 4 inches of the wall above: this thickness of it came down directly on to the piers, by means of 4-inch work and arches, in front of the bressummer. The facing-bricks of the wall, unless the work was executed very differently from what we usually find it, were probably but slightly tied into the inner 9 inches of the wall. Load the top of this with a projecting core for a cornice, and there, remembering too, that a nick 6 inches wide has been left out under the front 4 inches at the bottom of the piers, you have an arrangement very well calculated to give an unequal pressure, produce a slip, and bring down the whole.

FALL OF A GRANARY AT BECCLES.

DURING the late gales a loaded granary, recently erected, fell at Beccles, killing a bricklayer, who had gone to the wall for shelter from the wind. At the coroner's inquest, Mr. J. D. Botwright, of Bungay, builder, who had been appointed by the jury to examine and report upon the state of the ruins, and the probable cause of the accident, gave his report and evidence to the effect that the real cause of the accident was the want of ties. The materials were good, although the clamped red bricks of which it consisted were very much broken in the fall. The beams of the upper story were deflected 1½ inch, and ought to have had iron columns to support them in the centre, on account of the height of the upper story; but the want of strong iron anchors passing through the walls allowed the south wall to bulge ¾ of an inch, and was the main cause of the fall; the influence of the wind alone not being material. The proprietor of the granary said he was a merchant, and employed Mr. Ingram, of Beccles, to build the granary under the direction of Mr. Toll, as architect, whom he employed in his regular business as a merchant, and who was skilled in building, of which he had a great deal of practice. Another of his men acted as carpenter. He was aware the building would be subject to constant vibration from passing trains, and had it very substantially built on that account. The jury returned a verdict of "Accidental death," and adjudged "that the building fell from accidental causes," but added, "that they considered a want of judgment had been displayed in the construction of the building," and suggested "that iron columns and anchors and ties should be added to the building, in the manner named by Mr. Botwright."

CHURCH-BUILDING NEWS.

Findern.—The church here, according to the *Derbyshire Advertiser*, has been opened. The original parish church was much dilapidated. The new church, designed by Messrs. Stevens & Robinson, is built in the Early Decorated style, and stands on the old foundations, with additional length at the west end of nave, and a new north aisle separated from the nave by an arcade of three compartments, and cylindrical pillars, bases, and capitals. By means of these extensions increased accommodation for eighty persons has been obtained. Both porch and tower were for a long time doubtful features, and the detail is of the simplest kind. The size of the church internally is, nave 38 feet by 17 feet 9 inches, chancel 24 feet by 14 feet, north aisle 31 feet by 12 feet, tower 9 feet square. There is also a vestry and south porch. The highest point of the roof is 32 feet from the ground line, and the tower is 37 feet high to the springing of the spire, which is square, with four Lucerne windows, the total height being 77 feet. The roofs of the nave and chancel have trussed principals springing from corbels, and the north aisle trussed rafters, the whole ceiled between the rafters. The whole of the floors of passages, porch, and chancel, are of tiles, the latter boarded with alabaster. The total cost of the church will be about 1,450*l.*, and the work has been executed by Mr. Elliott, of Ashby. The heating, by Gill stoves, has been furnished by the Derwent foundry.

Manchester.—St. Ann's Church, Brindle Heath, has been opened for divine service. The site is the burial-ground of the old St. Thomas's Church. The church contains about 300 sittings, all free. In plan it consists of a nave of three and a half bays; a south aisle of three bays, divided from the nave by an unclerestoried arcade, the columns of which are circular, and the arches of two unchamfered orders. The main entrance is by a south-western porch, gabled transversely to the aisle. The chancel is entered from the nave by a broad and pointed arch, with moulded stone imposts, and rises two steps above the nave floor. The sanctuary rises one step more, and the Lord's table stands on a foot-pace. The south chancel aisle is screened off for organ chamber and sacristies. At the west end and in the centre of the nave is the font, of Bath stone, and circular in plan. Above the font, over two tall uncusped lancets, is a rose window, composed of eight quatre-foiled circles, with a sex-foiled circle in the centre. This has been filled with stained glass by Messrs. Edmundson. The subject is the legendary one of St. Ann teaching her daughter, the Virgin Mary, to read. There are, besides, symbols and grisaille work. The east window of the chancel, which is of three lights and traceried, contains "Christ, the good Shepherd," and grisaille work, with emblems, by Messrs. Heaton, Butler, & Bayne. The other windows are filled with plain tinted glass, in lead quarries. A Scudamore organ has been built by Eccleston & Bowes, and is placed behind the south choir seats. The heating apparatus was provided by Mr. Haden, of Trowbridge. The church is built of red brick, relieved with dark blue, in bands and patterns; and the roofs are covered with tiles ornamentally disposed. The south windows are broad, coupled lancets; and the north the same, with a trefoil or a quatrefoil above, inclosed under one pointed arch. Near the west end of the ridge of the nave roof is a wooden-framed belfry, covered with shingle. The churchyard has been put in order, and the walls nearly all rebuilt. The contract has been carried out by Messrs. Thackrah & Pierce, of Stockport, under the direction of the architect, Mr. J. Medland Taylor, of Manchester.

Frampton (Boston).—St. Michael's Church, Frampton, has been opened for divine service. The architect was Mr. Fowler, of Louth; and the contractor, Mr. White, of Alford. The plan consists of a nave, bell-turret, south porch, chancel, terminating in a semi-octangular apse, and vestry of the First Pointed period. There is an octangular bell-turret, with a Mansfield stone pillar set at each of its angles, springing from a carved corbel in the western front, and covered by a tapering spirelet. The whole church is built of Ancaster stone, and its roof is covered with brindled Staffordshire tiles. Within, the walls are lined with red brickwork, adorned by a band or cornice; chocolate and white terra-cotta quatrefoils, and relieved by courses of stone and white bricks.

Norwich.—The restoration of the parish church of St. Nicholas is being carried on. The estimated cost of the contemplated works is 20,000*l.*, and they must take some years to complete. It is proposed to divide the work into portions, but no part to be commenced until the amount estimated for its completion has been received. The committee propose to adopt the following order:—In the first year, the architect recommends that the tower be refaced. The tower is the central point of the building; it is therefore necessary that its safety should first be secured. All the heavy work of the tower ought to be completed before the roofs are touched. And special subscriptions have been received towards the restoration of the tower. In the second year, the chancel to be restored; the partitions dividing the chancel from the rest of the church to be removed; and the chancel, with the transepts, prepared to receive the congregation for Divine service. In the third year, the south aisle to be restored. In the fourth year, the west front to be refaced and the western pinnacles rebuilt. The further works contemplated to follow as may be determined.

Welton (Yorkshire).—The ancient parish church of Welton, which for nearly eighteen months past has been in course of complete restoration, has been re-opened. Both the interior and the exterior of the church have been restored. Mr. Scott was the architect employed, and in his opinion the church appears to have been built at the end of the eleventh century, but of the architecture of that period only a small portion of the tower piers remain. The chancel was in so utterly shattered a condition that it was necessary to rebuild it. The old form has been preserved as far as possible, but the nave, which was formerly excessively short, has been lengthened, and an aisle added on its south side. The chancel has been repaired, and the tower, which had lost its upper parts, has had a parapet added, and been otherwise improved. The style adopted is the Early Decorated. A large new painted glass window has been placed in the east end of the building, the cost of which is entirely defrayed by the Rev. T. B. Paget, the vicar. The subjects are the four Evangelists, and the work has been executed by Messrs. Clayton & Bell, of London. The whole of the church is fitted with stalls of carved oak. One of the communion chairs has been carved by Mrs. Paget, the vicar's wife. The cost of restoration (about 6,000*l.*), has been mainly defrayed by Miss Broadley. The clerk of the works was Mr. Sissons, of Hull; and the contractors for the rebuilding of the fabric were Messrs. Simpson & Malone, Hull.

Masborough.—The foundation stone of a new church, to be called the Church of St. John the Evangelist, was to be laid by the Archbishop of York on Monday last. The site is near the railway station. The church will be built in the Transition style, and will accommodate 800 persons; namely, 600 adults and 200 children. The cost will be about 3,000*l.*, exclusive of tower and spire, which will require another 1,000*l.* Nearly 3,000*l.*, or sufficient to complete the church, without the tower and spire, have been already subscribed. The whole of the seats in the church will be free and unappropriated. Mr. W. White, of London, is the architect; and Mr. C. Ripley, of Masborough, the builder.

Alnwick.—The works connected with the reconstruction and restoration of St. Michael's church, which have been going on for several months, are now completed; and the church has been re-opened for public service. The gallery has been removed. The clerestory windows have been filled up, and additional arches and piers inserted between the nave and aisles. The centre window, with another in the east end and three in the south front, the stone-work of which had become entirely decayed from lapse of time, and one in the west end, have been taken out and renewed with windows in the Perpendicular order, after the pattern of those removed. The old close seats have been replaced by open benches. The exterior has been repaired. Two new buttresses have been built on to the east end. A window has been inserted in the south porch, and the turret and staircase in the south-east angle of the church repaired. A new organ, by Messrs. Forster & Forster, of London, has been obtained, and placed at the north side of the church. The whole of the works have been executed under the immediate direction and superintendence of Mr. Salvin, architect; the contractors being Messrs. Smith, of London.

DISSENTING AND ROMAN CATHOLIC CHURCH-BUILDING NEWS.

Canterbury.—Miss Hales, the proprietress of the Hales Place estate, Canterbury, on which the show of the Royal Agricultural Society of England was held in 1860, entered a French convent some time ago. She has returned home, intending to build a convent on her own estate and at her own expense. The site, 30 acres in extent, has been marked out, and plans of the conventual buildings have been prepared by Mr. Pugin, of Ramsgate, architect. The proposed buildings, which consist of a church, convent, farm-buildings, &c., are to be inclosed within a high brick wall; and the contract for the buildings alone is 34,354*l.*

Cardiff.—The chief stone of a new Methodist Free Church has been laid here. The building,

which is in Guildford-street, will be in the form of an oblong square, having the principal entrance facing Bridge-street. The front is in the Grecian Doric style, being composed entirely of Bath stone, with large pilasters between the windows. The interior will be divided into three rows of open pews, running the entire length of the building, with a gallery along each side and one end of the building, affording accommodation for 800 people. In the centre aisle is a raised platform, instead of a pulpit. The place will be ventilated by means of roof ventilators, and warmed during the winter by hot air. The building is 70 feet long by 40 feet wide. The cost will be about 1,600*l*. The builder is Mr. Gooderidge, and the architects are Messrs. Hartland & Son, both of Cardiff.

Montgomery.—The foundation-stone of a new Wesleyan chapel has been laid here. It is in the Gothic style, and will accommodate 200 persons. It is entered from the south end by a porch constructed of wood, and glazed with rough plate-glass. At the south-east corner is a small bell-turret, covered with slates, and on the west side is the vestry. The sides of the chapel are terminated with transepts, which add to the height of the chapel. The walls are of red brick, with Bath stone dressings, and bands of green stone. In the interior, the pews are divided into three bays, with a pulpit at the north end, at the back of which is a five-light tracery-headed window. At the south end, over the porch, is a circular cusped window, and at the side of the porch is a two-light quatrefoil headed window. The east and west sides are each lighted with three two-light trefoil-headed windows. The amount of the contract is 380*l*. Mr. Evans, of Montgomery, is the builder, under the direction of Mr. Potter, of Welshpool, from the designs of Mr. W. H. Spaull, of Oswestry, architect.

Stretford (Manchester).—A new Roman Catholic church, dedicated to St. Ann, has been opened at Stretford by the Roman Catholic Bishop of Salford. The new church has been designed by Mr. E. W. Pugin. Sir Humphrey de Trafford has erected the church at his own expense. The west front stands 12 feet from the main road in Stretford, and comprises a gable 62 feet in height, in the centre of which is the chief entrance. Above the entrance is an immense wheel window, inlet with stained glass. It encloses eight cusped circles and a six-cusped circle in the centre. The window has a large cross with the figure of our Lord crucified. The window is enclosed by deeply recessed jambs and pointed arch mouldings. The only other important external features are the tower and spire, which are on the north side, and are almost entirely detached, owing to the comparative lowness of the aisles. The spire is about 130 feet to the top of the cross. The interior of the church is divided into nave, aisles, and sanctuary. Each aisle is lighted by nine two-light windows, with tracery heads, and is divided from the nave by pillars of red Mansfield stone, which are surmounted by carved foliated capitals, and support some moulded pointed arches. The roof of the nave is open to the edge, and the timbers are stained. The principals rest on carved corbels. The chancel roof is panelled, and the principals rest on carved caps, shafts of red Mansfield, and the bases thereof on angels. The reredos is 16 feet by 12 feet wide, consisting of three moulded recessed arches. In the centre is a group of seventeen angels, in full relief, adoring the monogram of our Lord. On each side are groups of ten angels adoring and holding towards the monogram the emblem of the Passion of our Lord. Crowning the arches is a cresting of angels and lilies, conventionally arrayed. The altar is 9 feet long, with green marble columns and carved capitals, of the wheat and the vine. In the frontal, deeply recessed, is a group, 7 feet, of the Four-and-twenty Elders, crowned, having harps, kneeling and adoring the Lamb on the throne, with the Book of Life,—the altar subjects representing the Old Law, and the reredos the New. The whole of the reredos and altar work was executed from the designs and under the direction of the architect, by Mr. R. L. Boulton, of Worcester, sculptor. The sanctuary is a continuation of the nave, and terminates in a four-sided apse, pierced by four large stained glass windows, of two lights each. The interior dimensions are as follows:—Extreme total length, 103 feet; aisles, 82 feet; chancel, 24 feet; extreme total width, 47 feet; the nave being 27 feet clear, and the aisles 5 feet. The aisles are merely passages, all the benches being in the nave, though, as in the latter the window recesses are deep, continued down to the floor, and have only piers between, the width may be called 8 feet. The height of the nave to the ridge is 52 feet, and similar height of aisles, 21 feet. The church is built of Yorkshire parpoints, with dressings of Stourton. Mr. Glaister, of Liverpool, was the contractor. The carving was executed, as we have said, by Mr. Boulton, of Worcester; and the stained glass and metal-work were by Messrs. Hardman & Co

Wexford (Ireland).—A new Roman Catholic church is being erected at Lady's Island, in the county of Wexford. The new church will consist of nave, chancel, aisles, tower, porch, &c., and will be in the style of the fourteenth century. Its extreme dimensions are, length, 108 feet; breadth, 44 feet; height to centre of groined ceiling, 40 feet. The tower and spire to the top of the cross will be 112 feet. The exterior masonry is of granite, with Whitehaven red sandstone dressings. Red, white, and black marble is used for the columns and base of the interior. The architects are Messrs. Pugin & Ashlin; the builders, Messrs. Pierce, of Wexford. The total cost will be about 3,500*l*.

SCHOOL-BUILDING NEWS.

Cranley.—The Archbishop of Canterbury has laid the foundation-stone of the Surrey County Middle-class Schools, at Cranley, near Guildford. The object sought is the provision of a sound and plain education, based on the principles of the Church of England, and on the public-school system, for the sons of farmers and others engaged in commercial pursuits. The plans are for a building to accommodate 100 boarders, and capable of enlargement if found necessary. An expense of 7,000*l*. will be incurred, towards which sum 4,000*l*. have been already contributed. The site fixed for the erection of the new schools covers nearly eight acres, and is not many yards from the proposed station of the Guildford and Horsham Railway. It is on a gentle eminence, commanding, on the south, a view of the village of Cranley, with its church and massive tower, pleasant extent of country, with that garden-like appearance for which Surrey is so famed. The ground was given by Mr. G. Cubitt, M.P. The buildings, which will be of brick, with stone dressings, and tiled roofs, are designed eventually to accommodate 300 boys, with the necessary masters and attendants, and will be quadrangular in form. The south wing will comprise the upper and lower schools, with class-room and corridor connected with the chapel, forming a portion of this wing, and with the north and south wings. The west wing will comprise a large dining-hall, 80 feet by 30 feet, for the use of 300 boys, with dormitories over. At the junction of the south and west wings will be placed the master's house, the infirmary, and other offices. The east wing will contain the under-masters' rooms, with the lavatory and baths on the ground floor, and two stories of dormitories over. The north wing will contain the offices for the whole of the school; and the kitchen and its offices will be placed in the centre of the quadrangle. The building will be erected from the designs of Mr. W. Woodyer. The contractor for the whole is Mr. Robert Futcher, of Fisherton Works, Salisbury; and the work will be carried out under the superintendence of Mr. P. Bentlif, his manager. The contract is taken for 8,000*l*. The style of architecture is of the simplest form of the Decorated.

Derby.—The Rose-hill Church Schools, Derby, have been completed. The room is capable of accommodating as a place of worship about 200 persons, and is provided with pulpit, desk, communion table, lectern, &c.; and is to be lighted by four six-light coronæ. The school building contains on the upper floor a room 55 feet long by 20 feet wide, and 20 feet in height. It is warmed by two of Mr. Jobson's gill stoves. The lower floor contains another room of similar dimensions, but 15 feet in height, to be fitted up as a school-room. There are separate entrances, yards, and outbuildings, as well as playgrounds for boys and girls. The access from the ground floor to the upper room is by a stone staircase in the entrance hall. The style of the building is Early English, carried out in red brick and stone dressings. The original design, which was furnished by the Rev. A. Oliver, admits of the addition of class-rooms at any future time. The entire cost will be about 1,000*l*., exclusive of the cost of the land, &c. Messrs. Giles & Brookhouse were the architects employed, and Messrs. Thompson & Fryer the builders.

Birkenhead.—Mr. William Jackson, M.P., has given 5,000*l*. towards the erection of Ragged schools at Birkenhead.

THE PUBLICATIONS OF THE SOCIETY OF ANTIQUARIES.

Sir,—Can any one explain the foolish delay that takes place in the publication of the "Proceedings of the Society of Antiquaries?" The object of such an issue would seem to be, to inform the Fellows scattered over the kingdom of what passes more quickly than can be done by the *Archæologia*, which comes out about twice in the year; and yet in the number just now issued, reference is made throughout to the reading of papers already issued in that publication. In other words, it will scarcely be believed when I say that the last part of the 8vo. "Proceedings" just now issued of this thoroughly-appointed and well-to-do society is dated "January to April, 1862." Such backwardness might have been understood and excused in the times when poor old Mr. Carlyle was secretary; but now, with a young and able man in the berth, it seems neither understandable nor excusable.

An Old "Fellow."

THE EARLY WATER SUPPLY OF LONDON.

In the year 1236 we first hear of artificial water supply in the metropolis. In 1285, the conduit in Cheapside, which had been fifty years in building, was completed. This was castellated with stone and cisterned with lead, and was situate at the east end of Cheap, at the junction with Bucklersbury, opposite Mercers' Hall, then the hospital of St. Thomas d'Acona.

The following seems to be the best list which can be obtained showing the date of the erection of the other London conduits:—

A.D. 1401, the "Tun" in Cornhill, so called from a prison of that name adjacent. It was originally a spring, but at the above date was made a cistern of sweet water conveyed in pipes from Tyburn.

A.D. 1423, Billingsgate Conduit, opposite the market, where Sir Richard Whittington built a reservoir for the use of the market people. This can be scarcely called a conduit, but a spring running from a "boss" in Boss-alley, so named therefrom. A spring which formed part of this water supply may still be seen, together with portions of a Roman residence, in the basement of the present Coal Exchange.

A.D. 1423, Cripplegate Conduit, St. Giles's Churchyard. Here Sir Richard Whittington made a "boss of clear water" in the walls of the churchyard; and in 1438 Sir William Eastfield brought water here from Highbury. Near this was a spring called Crowder's Well.

In 1433, the priors and canons of St. Bartholomew's, in Smithfield, constructed a conduit for the supply of the monastery, bringing the water from their estate at Canonbury.

A.D. 1438, Fleet-street Conduit, opposite Shoe-lane, built by Sir William Eastfield, lord mayor this year. This conduit was supplied from Paddington. Stow says that this had a fair tower of stone, was garnished with images of St. Christopher, &c., "with sweet-sounding bells before them, whereupon by an engine placed in the towers, they divers hours of the day and night chimed such a hymn as was appointed."

Aldermanbury Conduit, opposite the south side of St. Mary's Church. This was also erected under the will of Sir W. Eastfield; was destroyed by the Great Fire, and rebuilt; but was removed early in the eighteenth century.

A.D. 1478, Fleet Bridge Conduit, at the foot of the bridge over the Fleet river. This was erected to receive the overflow of the conduit opposite Shoe-lane.

A.D. 1491, Gracechurch-street Conduit, nearly midway between Fenchurch-street and Eastcheap.

A.D. 1498, Holborn Conduit, at the foot of Snow-hill. This was rebuilt by William Lamb,—the founder of Lamb's Chapel, near Cripplegate,—a citizen and member of the Clothworkers' Company,—in 1577, at a cost of 1,500*l*. The conduit was supplied from a head near the Foundling Hospital, on the east side of Lamb's Conduit-street, close to where the "Lamb Tavern" now stands.

A.D. 1500, Stock's Market Conduit, at the Lombard-street corner of the site of the present Mansion House. After its destruction by the Great Fire, the conduit was rebuilt at the cost of Sir Robert Viner, lord mayor.

A.D. 1505, Bishopsgate Conduit, at the junction of the Wards Within and Without.

A.D. 1528, Coleman-street Conduit, at the junction with London ward.

A.D. 1535, Aldgate Conduit on the site of the

present Aldgate Pump. This was originally a well called St. Michael's, converted into a conduit with sweet water from Hackney. This conduit was also destroyed at the Great Fire, and the cost of regaining the water, and putting the place into order, is charged at 452*l.* 15s. 10d. In this instance, as in many others, the conduit seems to have been erected on some well-known spring or other water supply. The water which has supplied the draughts at Aldgate Pump is from the ancient spring. Many will not be sorry that those City draughts are no longer available.

Lothbury Conduit, at the west end of St. Margaret's Church.

A.D. 1568, Dowgate Conduit, opposite Skinners' Hall, first erected in 1508. Stow says that there was in his day recently erected an engine to convey Thames water into Dowgate Conduit. In 1574, the channel from this conduit was so swollen by a storm of rain, that a youth of eighteen was carried by it into the Thames, and was lost in spite of all endeavours.

A.D. 1682, the Cornhill Standard, at the junction of Cornhill with Gracechurch, Leadenhall, and Bishopsgate streets. This was erected by Peter Maurise, a Dutchman, who conveyed Thames water over the steeple of St. Magnus, London Bridge, by an "artificial forcier," to the north-west corner of London-wall, whence it flowed to the Standard, and poured out by four mouths opposite the respective streets. This water supply ran only during the ebb tide, and became at times a nuisance by reason of its flooding the streets. Pepys refers in his Diary to this conduit eighty years after its erection. It was reduced to ruins by the Great Fire of 1666, and does not seem to have been replaced.

A.D. 1610, Aldersgate Conduit, without the gate; the precise spot not known.

Soper-lane Conduit: the date of its erection uncertain; and the same may be said of the Conduit on Old Fish-street-hill. This latter was, however, cisterned with lead, and castellated with stone, for receiving Thames water.

From the above notes, we may infer that, during the Roman occupation of London, there was a sufficient supply of wholesome water from springs and rivulets, so that the works being unnecessary, we find here no traces of those magnificent aquaducts which are to be met with in various parts of the Continent of Europe. Up to 1236, the natural water supplies seem to have been the only means of providing water for the domestic use of the Londoners. Then, from the beginning and towards the end of the fifteenth century, it became needful, in consequence of the increased population, to procure water from other sources. Afterwards the Dutchman's water supply, and Sir Hugh Myddelton's New River water were obtained; and now, although several great water companies have been formed on both sides of the Thames, the cry still comes for the increased and more pure supply of this important element of human life. We are not without hope that before the reign of Queen Victoria has ended, we shall have a proper system organized for the supply of this vast city. B.

FALL OF A HOUSE AT ISLINGTON.

SIR,—Having had many inquiries (from the similarity of the name) whether I was the architect of the above building, at which the sad accident recently occurred, I shall be obliged by your allowing me to state, through your columns, that I was not the architect, and was not in any way connected with the business.

GEORGE B. WILLIAMS, Architect.
Frederick's-place, Old Jewry.

WOOD-CARVING COMPETITION.

SIR,—May I venture to make a remark respecting the wood-carving competition in Kensington Museum? *Miserere* seats, when raised up, usually slant a little backwards, I think. In my specimen ("Gleaners") this fact was considered, and in its present perpendicular position the figures do not obtain their natural balance. Great attention is paid to this in placing a piece of sculpture upon its pedestal, and I think the same consideration should be afforded to a piece of wood-carving, however humble. J. M. LEACH.

COMPENSATION CASE.

ON the 10th inst., a jury was summoned to the Recorder's Court, Guildhall, to try a compensation case, Messrs. Jackson *v.* the City Extension Charing-cross Railway Company, Messrs. Jackson being the freeholders of Dowgate Iron Wharf, Thames-street, taken for the railway works.

The premises were let on lease at a net rent of 350*l.* per annum, with 6¾ years unexpired; but the last 15 years of the lease had been purchased for a premium of 2,300*l.* Mr. Sancton Wood was surveyor to the claimants, and evidence was given on the same side by Mr. Clifton, Mr. Horsey, Mr. l'Anson, Mr. M. Nelson, and Mr. R. Bell. The various estimates of these parties were from 15,394*l.* to 15,810*l.* For the Company, Mr. Pownall, Mr. Shaw, Mr. Lee, Mr. Vigors, and Mr. Ryde, the company's surveyor, were called. The first estimated the value of the freehold at 10,076*l.*; the latter, Mr. Ryde, at 9,240*l.* The company offered 9,500*l.*, which was declined. The verdict was for 14,630*l.*

The premises had a wharf with frontage towards the river of 41 feet by a depth of 183 feet, and a warehouse and dwelling-house on the land.

METROPOLITAN BUILDING ACT.

OPENINGS IN PARTY-WALL.

SOME years since, and before the coming into operation of the Metropolitan Building Act, 1855, an opening was made in the party-wall separating Nos. 66 and 67, Aldermanbury, in the City of London, in which were affixed double iron doors for the purpose of closing the opening when necessary.

In June, 1862, Messrs. Baggallay became the occupiers of No. 66, Aldermanbury, and shortly afterwards employed Messrs. Ashby & Horner to make two openings in the wall separating those premises from No. 6, Love-lane, each opening being 8 feet in height, and, in the one case, 2 feet 8 inches wide, and in the other 4 feet 10 inches wide. The premises, Nos. 66 and 67, Aldermanbury, and No. 6, Love-lane, were at that time wholly in the occupation of Messrs. Baggallay, and such premises, together, contained 323,000 cubic feet, but Nos. 66, Aldermanbury, and 6, Love-lane, together, contained less than 216,000 cubic feet.

In December, 1862, Mr. Woodthorpe, the district surveyor, served a notice on the builders to the effect that the openings in question were in contravention of the rules of the Building Act, inasmuch as they had been made in a party-wall dividing buildings which, taken together, contained more than 216,000 cubic feet, without the jambs, floor and head being formed of brick, stone, or iron, and the openings closed by two wrought-iron doors, of the thickness, and fixed in the manner, required by the provisions of the Building Act, and he called upon them to amend the work within forty-eight hours, accordingly. This not having been done, they were summoned before the magistrate at Guildhall, when they contended—

First—That the buildings upon which the works were done were not *new buildings* within the Metropolitan Building Act, 1855, and therefore that Act had no application, and they were not bound to comply with the requisitions of the district surveyor.

Secondly—That the making of the openings in question was not an alteration or work within the meaning of sec. 9 of the Building Act.

Thirdly—That the wall dividing No. 6, Love-lane from No. 66, Aldermanbury, was not, at the time the openings were made, a *party*-wall, but a *cross* wall within the meaning of the Act.

The magistrate, however, decided in favour of the district surveyor's views, and thereupon Messrs. Ashby & Horner appealed against the decision, and it was subsequently agreed that the question should be argued as a special case, which having been done on the 18th November, the Court gave judgment for the district surveyor, with costs.

Books Received.

Illustrated Edition of Hymns in Prose for Children. By Mrs. BARBAULD. London: John Murray, Albemarle-street. 1864.

A CHARMING edition indeed. Every page is illustrated, and the hymns, already extensively known, lend themselves peculiarly well to the requirements of the illustrators. The landscapes are by Mr. E. M. Whimperis, the figure subjects by Mr. R. Barnes, and the flowers and plants (very gracefully drawn) are mostly by Mr. T. Kennedy. The whole are well engraved by Mr. Jas. D. Cooper. We offer our praise to all concerned in the book.

A Welcome to H.R.H. the Princess of Wales, from the Poet Laureate. OWEN JONES, Illuminator. London: Day & Son, Lithographers to the Queen. 1863.

HERE, on seven ivory-like pages, besides the title-page, solidly bound in red and white, the contrast somewhat too violent, we have the Laureate's well-known lines beginning—

> "Sea-king's daughter from over the sea,
> Alexandra,"—

elegantly illuminated. Mr. Owen Jones's power of combining floral decorations seems inexhaustible, and he has that natural appreciation of the harmony of colours that whatever comes from his hand in this way is sure to be agreeable to the sight. The "Welcome" now before us is no exception to this rule, and will be placed on many tables,—graceful homage to our Rose of Denmark.

VARIORUM.

MESSRS. DAY have issued a new and cheaper, we may say cheap, edition of Cuthbert Bede's "Photographic Pleasures," full of sketches and full of fun. It is a pity the writing on the illustrations is not clearer.——"Lost, but not for Ever" (Nisbet & Co.), is a personal narrative "of Starvation and Providence" in the Australian mountain region, by the Rev. R. W. Vanderkiste. The author has a claim, inasmuch as he has been preaching the Gospel in the highways and byways of Australia during six years; but the tone of his volume is not agreeable. Still, he evidently knows his public (a special one), for this issue is marked "Third thousand."——"Journal of the Bath and West of England Society for the Encouragement of Agriculture, Arts, Manufactures, and Commerce. 1863. Vol. XI., Part 2. Ridgway, Piccadilly." This part contains a variety of papers, mostly useful to agriculturists. There is one, however, by Mr. Scott Burn, who, as our readers may recollect, is an amateur agriculturist, which requires more special notice. It is entitled "Some Cultural and Engineering Considerations connected with the Use of Water and Town Sewage in the Fertilization of Land." At the close of his practical and useful remarks on this subject, which refer chiefly to the mode of applying the sewage, and are illustrated, the author says:—"It may be a misfortune, but we believe that it is, nevertheless, a fact, that the view of the question which we have advanced forces us to the conclusion that the utilization of town sewage will not be carried out to a large extent in our day; seeing that the localities where it can be carried out in the way we have shown to be best are not likely to be often met with; so that, in many instances, its utilization at all will not be economically available. And further, that much of the supply, for years to come, even in the neighbourhood of localities thus favourably situate, must have the destination that it now has—the *river or the sea*—unless corporations convey it to or in the immediate neighbourhood of fields adapted locally and agriculturally to irrigation in its ordinary aspects."——"The Garden Oracle and Floricultural Year Book, 1864. Edited by Shirley Hibberd, F.R.H.S. London: Groombridge." Mr. Hibberd is the editor of the *Gardeners' Weekly Magazine*, and the author of various works on taste in gardening, &c., such as his essays on things homely and beautiful, rustic adornments for homes of taste, the town garden, &c.; and although this little "Year Book" is mostly compiled, still it is one showing some skill. Mr. Hibberd has introduced a new feature into such books by showing the progress of the seasons by the growth and flowering of plants in place of by saints' days, anniversaries, &c.; being, in fact, an arrangement of flowers for every day in the year, and some historical and horticultural information along with it. The book must be useful to all interested in gardening, whether in town or country.——From amongst the little Christmas story-books for youngsters sent to us for notice, we may pick out two or three,—"Fanny's Fancies," for instance, one of the Magnet Stories published by the Groombridges, and relating to a little lady whom one that knew her well,—the nurse of the "mite," to wit,—declared to be "a pickle, if ever there was one." Mrs. S. C. Hall is the author of this graceful little story.—"Peter Drake's Dream" is another of the choice little Magnet Stories, and by a lady—Frances F. Broderip, *née* Hood;—and "Bessy's Money," by the author of "Mary Powell" (Hall, publisher) is an interesting, though short and simple, tale of the time of Edward VI. and his successor, Mary; but better adapted for Protestant than Roman Catholic readers.

Miscellanea.

SMALL-ARMS MANUFACTORY AT BIRMINGHAM. At Small Heath, Birmingham, a small-arms manufactory is being built on the plan adopted at the Enfield and London Armoury Company's Works, where every part of the weapon is made in the factory. Being constructed by machinery, all the parts are alike, and can be interchanged.

THE NEW OPERA-HOUSE, PARIS.—We learn that the task of decorating the grand staircase of the New Opera at Paris has been confided to M. Cabanel, and the paintings in the *foyer* to M. Baudry. The group which is to surmount the dome will be executed by M. Perrault, and the statues of the two principal pavilions by MM. Cavelier and Aimé Millet.

A CHEAP MATERIAL FOR PUBLIC BUILDINGS. The people of Plymouth are desirous of building a new Guildhall, the present one being much too small. A site can be had near St. Andrew's Church, but the difficulty is the want of funds. This, however, might be overcome, we think, if the advice of one or the town councillors were taken, viz., to build it *out of the sound of the church bells.*—*Punch.*

RAILWAY TRAFFIC RECEIPTS.—The traffic returns of railways in the United Kingdom, published for the week ending the 28th of November, amounted on 11,028 miles to 568,105*l.*; and for the corresponding week of 1862, on 10,518 miles, to 517,569*l.*, showing an increase of 450 miles, and of the sum of 50,536*l.* in the receipts.

MOSAIC WORK FOR LONDON.—Mr. Grote, the historian of Greece, who is one of the council of University College, London, has offered to put up at his own expense, on the walls of the cloister of the college in Gower-street, a mosaic representation of scenes and persons of the Homeric poems, to be executed by the Parisian sculptor, the Baron de Triqueti.

FEVER IN DOWNPATRICK, IRELAND.—The proceedings of the local board of guardians, reported in the *Downpatrick Recorder*, show that fever prevails there, and is considerably on the increase. In the County Fever Hospital, also, this is the case. Ventilation and cleanliness, as well as aid in food and clothing among the poorer classes, are very properly urged by the *Recorder*.

FALL OF A SCAFFOLD AT GLASGOW.—A serious accident has occurred at a new building in course of erection at 298, Duke-street, Glasgow, whereby one man was dangerously, and several others seriously, injured. It appears that six labourers and a mason were carrying up a large stone to the top story of the building, and when they reached the fourth landing the scaffold upon which they were standing gave way, and the unfortunate men were precipitated through the joisting to the ground from a height of five stories.

MONUMENTAL. — A colossal statue of Daniel O'Connell, intended to be erected on the site of the old Court-house at Ennis, has been executed by Mr. Cahill, the Dublin sculptor. The statue is of white limestone. The head is copied from that of O'Connell's statue by Hogan, in the Royal Exchange. Mr. Cahill has enveloped the form in a cloak, with a fur collar, a characteristic feature of O'Connell's costume. The sculptor, according to the Dublin *Newsletter*, was for some years the chief assistant of the late John Hogan.

THE BIRMINGHAM TALL CHIMNEYS.—A coroner's inquest has been held on the death of a person killed by the fall of Mr. Salt's chimney in Birchall-street during the late terrific gale. The verdict was "Accidental Death." Birmingham is crowded with tall chimneys, many of which may be wanting in some of the points regarded as deficient in the one erected by Mr. Salt. The chimney in Birchall-street had been erected by a regular stack builder, but it was 9 inches thick where it was considered that it only ought to have been 4½ inches, and tapered at the rate of but an inch in three yards, when the proper ratio was estimated at 1½ inch per yard.

A SMOKY CHIMNEY.—"I have just succeeded," says Mr. C. Butler Clough, in the *Mining Journal*, "in curing an obstinate smoky chimney by the aid of a zinc covering outside a common earthenware chimney-pot, having two openings in the zinc, one east and the other west. There are also two partitions or stoppers, north and south, to prevent the draft from escaping by the opposite opening. By the aid of this contrivance an upward current of air is carried outside the flue to its top, on the windward side of the chimney. I have now had the plan in use for some time, and in the face of several most violent storms not a particle of smoke or soot has come down the flue. In other rooms, the soot was blown on the floor to a large extent."

AN OFFICIAL WHIM.—Manchester is greatly excited by one of the oddest acts of official tyranny we ever remember to have seen recorded. There is a place near the city known as Alderley Edge, which has grown into a kind of suburb for the wealthier citizens. It was prospering quietly enough, when suddenly all its letters were seized, carried to Congleton, and there re-directed to "Chorley," the new postal name ordered by the Postmaster-General. The unlucky inhabitants protested that the place had been called Alderley Edge since the Conquest, but without effect. The Postmaster-General is Lord Stanley, of Alderley; and, according to Manchester belief, he is determined that his lordly name shall not be borne by a thriving colony of vulgar villas which do not belong to him. The story seems incredible, but it is repeated in shoals of letters from the inhabitants of the place unlucky enough to possess a name which Lord Stanley wants to keep exclusively to his own property. Is there no right of action against the Postmaster-General as a common carrier?—*Spectator*.

TENDERS.

For alterations and additions, at the Freemasons' Hall, Great Queen-street, Lincoln's-inn-fields. Mr. Cockerell, architect. Quantities supplied by Messrs. Wilson & Goodchild:—

	Contract No. 1.	Contract No. 2.	Total.

USEFUL INFORMATION for ENGINEERS.
By WILLIAM FAIRBAIRN, LL.D. President of the Literary and Philosophical Society of Manchester, &c.
Also, by Mr. FAIRBAIRN, 2 vols. 8vo. price 15s. each,
TREATISE on MILLS and MILLWORK (now complete).
The APPLICATION of CAST and WROUGHT IRON to BUILDING PURPOSES, Third Edition, nearly ready.
London: LONGMAN, GREEN, & CO. Paternoster-row.

ARTS, MANUFACTURES, MINES.
Complete in 3 vols. 8vo. with nearly 2,000 Wood Engravings, price 42s. cloth lettered, or 45s. 6d. strongly half-bound in russia; to be had also in 13 parts, price 3s. each,
DR. URE'S DICTIONARY of ARTS, MANUFACTURES, and MINES. Fifth Edition, chiefly rewritten and greatly enlarged. Edited by ROBERT HUNT, F.R.S. F.S.S. Keeper of Mining Records, &c.; Assisted by numerous Contributors eminent in Science and familiar with Manufactures.
"There can be no question as to the great superiority of this work over that of Dr. Ure; and indeed it is not with strict propriety that is now called 'Ure's Dictionary' at all: it is, to all intents and purposes, 'Hunt's Dictionary.' Mr. Hunt having not only been the editor, but to a great extent the compiler; although with important aids, of such men as Dr. Hemmah, Dr. Angus Smith (who wrote the articles on 'Sanitary Economy,' a novel feature in such a work), Sir William Armstrong, Mr. Alfred Tyler, Professor Walker, of the Agricultural College, Cirencester, Professor R. D. Thomson, the chemist; Mr. G. Ansell, of the Mint; Mr. Dufresne, sub-editor of the *Art Journal*; Mr. Fairbolt, Prof. Frankland, Dr. Normandy, Mr. Lonton, Dr. Noad, and many others,—all able and competent men in their several callings, as the editor himself is well known to be, not only as the keeper of mining records, but as a man of science generally, and therefore specially competent as the editor of such a work as this. The book, on the whole, constitutes an important and standard addition to the records of the arts and sciences."—*Builder*.
London: LONGMAN, GREEN, & CO. Paternoster-row.

NEW EDITION OF MISS NIGHTINGALE'S WORK ON HOSPITALS.
Just published, in post 4to. with 13 Plans, price 18s.
NOTES on HOSPITALS.
By FLORENCE NIGHTINGALE.
Third Edition, enlarged and for the most part re-written.
London: LONGMAN, GREEN, & CO. Paternoster-row.

TO ARCHITECTS
MR. CHARLES WARREN,
Architectural Colourist,
No. 9, Portland gardens, Notting-hill, London, W.

NOTICE.
MR. FENTON,
Late Engineer and Surveyor to the Croydon Local Board,
Office—No. 8, Cannon-row, Parliament-street, Westminster, S.W.

TO ARCHITECTS, ENGINEERS, &c.—Mr. T. ARTHUR RICHARDSON, Architectural Artist, 1, Tachbrook-street, Pimlico, London, S.W. prepares perspectives in outline, pencil or ink, etched or highly coloured in water or oil. Every other description of architectural assistance on moderate terms.

TO ARCHITECTS.
PARTNERSHIP.—The Advertiser, who has had considerable experience in Gothic design, and the general routine of an office, wishes to JOIN an ARCHITECT of well established practice. A premium will be paid.—Address, A. W. D. "Mercury" Office, Derby.

PARTNERSHIP.—An ARCHITECT, aged 28, skilful in design, a thorough ornamentist and colourist, and well acquainted with the routine of office work, is desirous of becoming a PARTNER in a well established PRACTICE, either in London or a leading provincial town. Address, with full particulars (before the 25th inst.), to ALPHA, care of Philip, Son, & Nephew, South Castle-street, Liverpool.

PARTNERSHIP.—A LAND and ENGINEERING SURVEYOR, of good practice, who has been established twenty years in a country town, wishes to take a PARTNER with a view to RETIREMENT. Address, SURVEYOR, care of Mr. Hart, Gray's-inn Coffee-house, Holborn, London.

PARTNERSHIP.—To ENGINEERS, ARCHITECTS, or BUILDERS.—TO BE DISPOSED OF, in JANUARY next, a JUNIOR PARTNERSHIP, in a well-known Builders' Engineer's business in London, in successful operation for the last twenty-five years, to take the place of a retiring partner, and manage the factory. Capital required 1,000*l*. Apply to R. W. care of Messrs. Taylor, Hoare, & Taylor, Solicitors, 28, Great James-street, Bedford-row.

PARTNERSHIP.—A Young Architect, desirous of establishing himself in the profession, can PURCHASE a SHARE or the WHOLE of a GOOD COUNTRY PRACTICE of an ARCHITECT and CIVIL ENGINEER, in London, much engaged upon railway works. A moderate premium expected.—Apply, by letter, to H. H. Messrs. Adams & Co. 9, Parliament-street, S.W.

AN ARCHITECT and SURVEYOR, in the healthiest sea-coast town in England, has an OPENING in his Office for a well-educated YOUTH, as PUPIL, for two or three years.—For terms, address, G. K. L. Office of "The Builder."

TO PARENTS AND GUARDIANS.
A CIVIL ENGINEER, in extensive Practice in the vicinity of London, and having important railway and first-class works in hand, is desirous to receive a well-educated Youth as an ARTICLED PUPIL. Unusual practical opportunities are offered. Premium required.—Address, D. C. E. Office of "The Builder."

A LONDON BUILDER and CONTRACTOR will shortly REQUIRE the SERVICES of a GENERAL MANAGER, practical, active, and thoroughly accustomed to the conduct of works and the most correct of workmen, and who can be well recommended. None other need apply. Address, with particulars, to W. W. POPE, Office of "The Builder."

GAS and GENERAL ENGINEERING OFFICES, 1, HANOVER-STREET, EDINBURGH (opposite the Royal Institution of Arts). Mr. JOHN ROMANS, Practical and Civil Engineer, may be consulted at the above address in all matters pertaining to gas-works, water-works, and other engineering purposes. Plans and specifications furnished, works erected and repaired, or taken on lease for a term of years.—Orders received for Scottish Canne, Coal and Fire clay goods.

AN ARCHITECT and SURVEYOR has an OPENING for an ARTICLED PUPIL in his Office, who would have an excellent opportunity of acquiring a thorough knowledge of the profession. A moderate premium required.—Address, Mr. STANHAM, Architect, 22, Old Broad street, E.C.

CANTERBURY PAVEMENT.—Notice is hereby given, that at the next Meeting of the Commissioners of the Canterbury Pavement, which will be holden at the Guildhall in the said City of Canterbury, on WEDNESDAY the 13th day of JANUARY next, at TEN o'clock in the forenoon, the said Commissioners will APPOINT a HAND-STONE MASON, to act as Working Foreman under the Commissioners. He must have been well experienced in paving, be qualified to keep accounts, and will be required to devote the whole of his time to the works the Commissioners may from time to time have in hand. CANDIDATES for the APPOINTMENT must make APPLICATION, in writing, to the Clerks, at their Office, Watling-street, Canterbury, on or before the 12th day of JANUARY next, such application to be accompanied with testimonials as to ability and character. Salary, 80*l*. per annum.—By order of the Commissioners,
WIGHTWICK & KINGSFORD, Clerks.
Canterbury, 10th December, 1863.

THE OSWALDTWISTLE LOCAL BOARD.—SURVEYOR and INSPECTOR of NUISANCES.—The Local Board for the District of Oswaldtwistle, in the County of Lancaster, requires the services of a properly qualified Person to perform the duties of SURVEYOR and INSPECTOR of NUISANCES. He will be required to reside within the District, and to devote the whole of his time to the duties of the Offices. Salary 80*l*. per annum. Applications, with Testimonials, to be sent on or before the 31st day of DECEMBER, 1863, to the Local Board Offices, Oswaldtwistle, near Accrington, Lancashire, addressed to "The Chairman of the Highway and Drainage Committee."
(By order) JOHN PICKUP, Law Clerk.
Oswaldtwistle, 30th November, 1863.

TO SURVEYORS.—The Guardians of the West London Union hereby give notice, that they will on TUESDAY, the 29th day of DECEMBER instant, at THREE o'clock, proceed to APPOINT a SURVEYOR to take out the QUANTITIES for their NEW WORKHOUSE BUILDINGS and PREMISES, to be erected at Hanwell.—Gentlemen who are desirous of applying for the appointment, must do so by letter, prior to the above day, stating terms, &c. and addressed to me as below.
Dated this 14th day of December, 1863.
(By order) JOHN JONTIFFEX, Clerk to the Guardians.
5, St. Andrew's-court, Holborn, E.C.

WANTED, a PARTY as AGENT, able to undertake the entire management of a railway (in the absence of the principal) now about to commence. OCTAVIUS N. SIMPSON, STAMFORD;
and see Specimens at the Office of
Messrs. PINDER SIMPSON & SONS, 29, Savile-row, London, and at the Museum of Practical Geology, Jermyn-street, W.
This stone (which is a perfect oolite), is raised in blocks of any portable size, and is about four feet thick in the bed. It will stand ANY WEATHER, is much used for water-works, and for the building and restoration of churches. When used as ashlar work it is not necessary to place it bed-wise. It works freely with a tooth-saw, and is wrought at a cheaper rate than any stone in the kingdom.

W. HOLLAND, Pavior, Mason, and Road Contractor.
Aberdeen, Guernsey, Mount Sorrel, and Hayter Granite Depôt.
Paving Works done in town or country
Gravel Wharfs, 67, Augusta-street, Regent's Park Basin.

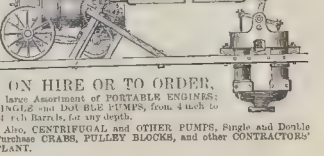
TISBURY STONE.
The WARDOUR (CHILMARK) and TISBURY STONE COMPANY, Limited,
Are prepared to execute orders to any extent for their TISBURY STONE.—This is a close, fine-grained Stone, of a beautiful colour, possessing all the qualities of the best Portland, in which range it is placed geologically.
It will supply the long-wanted desideratum of the Architect, Builder, and Sculptor, as the Stone is a first-class Weather Stone, easily worked, and carries a fine arris; and is eminently adapted for carved mouldings, high-class architecture, and works of art, requiring only to be known to become the
STONE OF THE DAY.
Specimens, Price, &c. may be obtained of
SAMUEL TRICKETT,
General Stone Merchant, Millwall; or at the Offices of the Company, 3, Auckland-place, London Bridge.

WILLINGTON STONE WHARF,
REGENT'S PARK BASIN, N.W.
HY. GEORGE & CO.
MARBLE and STONE MERCHANTS. Marble, in blocks and sawn slabs; Yorkshire stone of every kind in ditto; paving, landings, steps, sills, kerbs, &c.; Bath, Caen, Portland, Aubigny, and Granite. Cargoes direct from the quarries. Wrought work executed at moderate prices.
Agent, JOSEPH CHADWICK.

SLATES.—JONES & CO. have a STOCK of SLATES of different sorts, from the best quarries in Wales. SLABS and CISTERNS delivered at any station in quantities of not less than five tons, from their depôts, Bangor, Garston, Baitney, Chester, and Gloucester.
Prices forwarded and estimates given on application.
1, BOLD TERRACE, CHESTER.

SLATE SLABS and CHIMNEY-PIECES.
A CARGO of the above FOR SALE.—Apply to WILLIAM PEARSON, 22, Leadenhall-street, E.C.

ABOUT 15,000 SLATES, of different sizes, and about 16 tons of SLABS, will be SOLD, cheap, at the Grosvenor Slate Works, Pimlico.



O. M'CARTHY, CARMAN, and SAND and CEMENT MERCHANT, Whitefriars Wharf, Whitefriars, Fleet-street, City. Sand from above or below Bridge, delivered by the yard or per barge. Ballast, a second or unscreened, by the yard or per large Stocks, Lime, and Old Bricks. Dry Rubbish delivered, per Large, in any quantity alongside the Thames.

TO ARCHITECTS, BUILDERS, &c.—VENTILATION WITHOUT DRAUGHT.—S. FLEXEN'S "PATENT VENTILATOR" supersedes all others now in use, and prevents draught, smoke, dust, or vapour from entering an apartment. Can be fixed to any kind of sash.—Models can be seen at 81 Office, 46, Skinner-street, Snow-hill, London, E.C.

PATENT WORCESTERSHIRE RANGE.

PRIZE MEDAL 1862, AWARDED FOR EXCELLENCE.
The above RANGE is most complete, and strongly recommended for its unrivalled ECONOMY, CLEANLINESS, CONVENIENCE, DURABILITY, and is a certain CURE for SMOKY CHIMNEYS.
It is an entirely new invention, and consists of large MEAT ROASTER, PASTRY OVEN, and WROUGHT-IRON BOILER. The top forms a HOT PLATE for BOILING, STEWING, &c. The whole heated by ONE SMALL FIRE. One 5 feet wide is equal to an ordinary Range 8 feet wide.
Extracted from the "London Daily Telegraph," May 19th, 1862.
"INTERNATIONAL EXHIBITION, CLASS 31
"Of the most recent inventions is a stove called the Patent Range, by Messrs. JONES & ROWE'S Patent Worcestershire Range has attracted very special attention, and has been commended by the best authorities. A valuable peculiarity of their Ranges is the placing of the OVEN and ROASTER one above the other instead of side by side; and the ROASTER is constantly replenished with fresh air."
INVENTORS AND MANUFACTURERS,

CONTRACTORS FOR ROOFING THE GREAT EXHIBITION BUILDING OF 1862.
By Her Majesty's Royal Letters Patent.
F. McNEILL & CO. of LAMB'S BUILDINGS, BUNHILL ROW, LONDON,
Manufacturers and ONLY Patentees of
THE PATENT ASPHALTED FELT, FOR ROOFING HOUSES, VERANDAHS, SHEDS, &c.
Patronized by
HER MAJESTY'S WOODS AND FORESTS,
HER MAJESTY'S COMMISSIONERS OF CUSTOMS,
HONOURABLE EAST INDIA COMPANY,
HER MAJESTY'S WAR DEPARTMENT,
HER MAJESTY'S ESTATE, ISLE OF WIGHT,
ROYAL BOTANICAL GARDENS, REGENT'S PARK.
And by the most eminent members of the Royal Agricultural Societies of England, Scotland, and Ireland, at whose great national shows it has been exhibited and OBTAINED THE PRIZE, or being the best and cheapest article for roofing; also referred for similar slates at the Royal Agricultural Society's House in Hanover square. Its valuable properties are lightness, warmth, durability, and economy. It is impervious to rain, snow, and frost, and a non-conductor of heat and cold. The Felt can be cut to any length, by 32 inches wide. The price is only ONE PENNY PER SQUARE FOOT. Samples, with full directions as to its use, and the manner of applying it, with TESTIMONIALS, some of them of seven years' experience, from Architects, Builders, Noblemen, and Gentlemen, who have exclusively used it, sent free to any part of the town or country. DRY HAIR FELT, for covering Boilers, &c. is also manufactured, by which a saving of about 25 per cent in fuel is effected. The TRADE are respectfully explained to send their orders DIRECT to the FACTORY, as the surest means of being supplied with a good article, and in lengths best suited to their roofs. The original works where the above roofing is made are F. McNEILL & CO'S Manufactories, LAMB'S BUILDINGS, BUNHILL ROW. Roofs covered with McNEILL'S FELT to be seen at the CAMPS of ALDERSHOTT, CURRAGH, SHORNCLIFFE, and COLCHESTER, upwards of Three Millions of Feet; also the GREAT EXHIBITION BUILDING of 1862, of nearly One Million Feet. A Liberal Discount allowed to the Trade

HUBBUCK'S PATENT WHITE ZINC PAINT.
By their process, which is patented, pure Zinc Paint is Cheaper than White Lead. It does not change colour with the London atmosphere
ADULTERATIONS. Some Paint Grinders have been selling Zinc Paint adulterated with Sulphate of Barytes from ten to thirty per cent. Whether so, under the name of "Improved Zinc Paint," or as the number Two or Three qualities, no workman can produce good work with such material. Workmen who have once used the Patent Zinc Paint will never willingly use any other Paint for their best work.
CHEAPNESS.—Not only is it cheaper per hundred weight, but two hundred weight of this Paint, with six gallons of oil covers as much surface as three hundred weight of white lead and twelve gallons of oil.
EACH CASK IS STAMPED "HUBBUCK, LONDON, PATENT"
THOMAS HUBBUCK & SON,
WHITE LEAD, OIL, PAINT, AND VARNISH WORKS, 34, LIME STREET, LONDON.

TERRA COTTA and Fine STONEWARE
POTTERY, warranted to stand Frost.
JOHN M. BLASHFIELD, STAMFORD POTTERY, STAMFORD, LINCOLNSHIRE, has greatly improved and economised the manufacture of TERRA COTTA and Fine STONEWARE for ARCHITECTURAL PURPOSES. He is able to make it of various new colours, so as to harmonize with Marble, Porphyry, and other Stones, and equal it in hardness to Granite.

A Medal at the International Exhibition was awarded, in Class 10, Section C, Architectural Objects, for "Perfection in manufacture and beauty of form." A Medal was also awarded for "Terra-Cotta."

Moulded Bricks, String Courses, Copings, Cills, Tracery, Balusters, Capitals, Cresses, Pinnacles, Vases, Statues, Brackets, Consoles, Garden Edging, Guttering, Sink, Trade, and twelve inch Paving Tiles, &c. &c.

Also Plain and Mosaic Pavements for Halls, Churches, Conservatories, &c. in all colours.
London Office, 377, Oxford-street, W.

JOHN UNDERWOOD,
ARCHITECTURAL and MONUMENTAL WORKS, 47, High-street, Camden Town, executes every description of Architectural and Monumental Sculpture in the best style of workmanship, at moderate charges. Estimate submitted free.

TWO PRIZE MEDALS AT THE INTERNATIONAL EXHIBITION.
MAGNUS'S ENAMELLED SLATE
obtained the Medal of the Society of Arts, the Prize Medal at the Great Exhibition, 1851, Two First-class Medals at the Paris Exhibition, and Two Prize Medals at the International Exhibition of 1862.

Trashy imitations of this beautiful material are being palmed upon the public. Architects are therefore requested to see that the name of "MAGNUS" is upon each article.

Chimney-pieces, Billiard-tables, Table-tops, Baths, Wall-linings, &c. a New Illustrated Catalogue of which can be had at the Pimlico Slate Works 39 and 40, Upper Belgrave-place, Pimlico, S.W.

PRIZE MEDAL TO MAW & CO. INTERNATIONAL EXHIBITION 1862.
IMPERISHABLE TESSELATED
PAVEMENTS, combining a highly decorative and economical substitute for ordinary floors of their perishable coverings. MAW & CO.'S Pattern-book, designed by M. Digby Wyatt, esq. together with a special design and estimate of cost adapted to any given dimensions of hall, passage, conservatory, verandah, frieze, &c. will be sent on application to Benthall Works, Broseley, Salop.

May be seen at the Exhibition of Building Inventions, &c. now open at the Galleries of the Architectural Exhibition, 9, Conduit-street, free.

London Agents—W. B. SIMPSON & SONS, 456, West Strand, who have on view a great variety of Specimens of the Pavements.

PEAKE'S TERRO-METALLIC TILES,
PIPES, &c.—Notice is hereby most respectfully given, that the LONDON DEPOT for the WARE is REMOVED to No. 21 Wharf, Macclesfield-street North, City Road Basin, S. Also, that the trade term, "TERRO-METALLIC," is the exclusive right of the Proprietor; and lastly, that the "Reports of the Juries," page 681, of the Great Exhibition, 1851, note the grant of a First-class Medal and rank the Manufactories known so long as "The Tileries," Tunstall, Staffordshire, as the first of the kind in the world.

MONEY on FREEHOLD and LEASEHOLD PROPERTY, by the
MUTUAL LOAN FUND ASSOCIATION
(Incorporated by Act of Parliament, 1860), 14, RUSSELL STREET, Covent Garden, W.C. Advances from £50 to 1,000l. upon Freehold and Leasehold Property for any term up to ten years. Mortgages redeemed, and the advance can be repaid by easy instalments. Facilities afforded to tenants to purchase the houses they occupy, and the repayment of the advance by ground rent. Greater advantages are offered to borrowers than in building societies, these being no shares to subscribe for, or competition for an advance, and no deduction from the loan. No preliminary fees. Prospectus and forms of proposal sent on receipt of a directed stamped envelope.
EDWARD HARPER, Secretary.

F. HALL & SON will SELL by AUCTION, on TUESDAY, DECEMBER 22nd, at TWELVE o'clock, on the PREMISES, at the Chine Hall, Kinglee-road, Rotherhithe, an Extensive Assortment of Capital BUILDING MATERIALS, comprising 14 excellent cast yellow joists, 500 feet of nearly new flooring boards and battens, a lot of yellow scattering stout plates 28 feet long, clean rafters and ceiling joists, several pairs of modern sash and frames, four inch and other doors, several flights of stairs, 50 Paris and other chimney pieces and hearths, 40 stone steps, and other useful effects.—May be viewed and catalogues had on the Premises, and of the Auctioneers, Kennington, S.

THE OLD FAMILY MANSION, FORSTON HOUSE, with its additions, lately occupied as the Pauper Lunatic Asylum of the county of Dorset, for SALE.—Early in next year will be offered for SALE by PUBLIC AUCTION, at Dorchester the whole of those Premises, consisting of the old mansion, with buildings erected for the accommodation of 150 patients, and suitable domestic offices, airing yards, stabbing, and farm buildings. The site, which, together with the gardens and paddocks, contains about nine acres, is all walled in. The place is situated about four miles from Dorchester, and is bounded on the western side by the turnpike road leading from Dorchester to Cerne Abbas, and on the north and east by lands belonging to R. B. Sheridan, Esq. M.P. and on the south by the property of Henry Charles Sturt, Esq.

A small river runs through the length of the property between the Turnpike-road and the Gardens, and the water required for the Establishment is at present pumped up by a water-wheel, and there are two steam engines applicable for the purposes with hot water. There is a Lodge Cottage at the entrance. The Mansion, which has been occupied by the superintendent, is situated at the south end of the premises, and the present time from the residence of some of the county families. The place may be seen on application by letter, addressed to J. G. SIMMS, Esquire, Medical Superintendent; and further particulars may be had by applying to Mr G. EVANS, the County Surveyor, at Wimborne, Dorset.

SYDENHAM HILL.—LAND TO BE LET, for Building, 420 feet frontage, average 500 feet deep, Beautiful site, with extensive prospect, and fronting a high road. Close to three railway stations, and within ten minutes' walk of the Crystal Palace. May be laid in one, two, or three plots for detached residences.—For particulars, apply personally to Mr. HENRY DAWSON, Architect, 19, Finsbury place South, E.C.

WANTED to RENT, PREMISES, containing an area, collectively, of about 20,000 feet One building, containing the above accommodation in different floors, would be preferred, but the parties would be prepared to treat for a block of several houses.—Address, with full particulars, to Messrs. JENNINGS & SON, Solicitors, 18, Bennett's-hill, Doctors' Commons, E.C.

HAMPTON, MIDDLESEX, on the Banks of the Thames, and close to the intended Thames Valley Railway Station —TO BE SOLD, or LET, on Building Leases, Eligible BUILDING LAND.—For particulars, apply to J. WHEATLEY, House and Estate Agent, East Molesey.

BUILDING GROUND TO LET.—GREAT TOWER STREET, in the City of London.—The Commissioners of Sewers of the City of London will meet in the Guild hall of the said City on THURSDAY, the 8th day of FEBRUARY next, at HALF-PAST TWELVE o'clock precisely, to receive proposals for taking BUILDING LEASES, for a term of eighty years (the first year at a peppercorn rent), certain PLOTS of FREEHOLD LAND, situate in Great Tower street, in the City of London, at the centre of the Corn and Coal Exchanges.—Further particulars, with conditions and printed forms of tender, may be had on application at the Office, where plans of the ground may also be seen. The Commissioners do not bind themselves to accept any proposal unless deemed advantageous. Persons making proposals must attend personally, or by a duly authorized agent, on the above-mentioned day, at HALF-PAST TWELVE o'clock precisely, and the parties whose offers are accepted will be required to execute an agreement and a bond at the same time. JOSEPH DAW, Principal Clerk.

Sewers Office, Guildhall, November 6, 1863.

FREEHOLD LAND TO BE SOLD, or LET on BUILDING LEASES. About Two Acres at Forest-hill, near the Station; One Acre at Norwood Junction Station; Two Acres at Chesilgurst, Old Kent-road. Also a WHARF TO LET, at Kent-road Bridge.—Apply to Mr. MAY, Acorn Timber wharf, Old Kent-road.

WANTED, a FREEHOLD or very long LEASEHOLD HOUSE or PREMISES, from 40 to 50 feet frontage by 100 feet in depth, with early possession, in any of the large thoroughfares The Strand, Fleet street, or Ludgate-hill preferred, or a vacant site would be purchased.—Full particulars to be sent to Messrs. DRIVER & CO. Surveyors, Land Agents, and Auctioneers, 4, Whitehall, London, S.W.

VAUXHALL GARDENS ESTATE.—Several very valuable SITES on the above Freehold Estate, TO BE LET, for Building purposes.—Apply to Messrs. DRIVER & CO. Surveyors, Land Agents, and Auctioneers, 4, Whitehall, S.W.

KEYNSHAM BLUE LIAS LIME and CEMENT WORKS, Somerset.—TO BE SOLD, by PRIVATE CONTRACT by order of the Liquidator, the newly-formed FREEHOLD WORKS, occupying a site of 7 acres, 2 roods, and 28 perches, or thereabouts. The existing kilns and ovens are capable of producing 700 to 800 tons of lime, and 120 tons of cement weekly, both produces being approved of by large contractors and eminent architects, the cement being used in parts of the Government fortifications now in progress. The buildings are very substantial, and the machinery is of the best description, driven principally by water-power, but with steam power as auxiliary. Coals are supplied to the works at a very low price, and the Great Western Railway Station is within a short distance.—For further particulars, apply to Messrs. N. LINDO & SONS, Solicitors, 47A, Mongate-street; to F. MAYNARD, Esq. Liquidator, 19, Bread-street, Cheapside; and to Messrs. FULLER & HORSEY, 13, Billiter-street, London.

FREEHOLD MILLS, with good Water-power, Keynsham, Somerset, well adapted for Corn Mills, Oil Mills, or Paper Mills, TO BE SOLD.—Apply to Messrs. FULLER & HORSEY, Billiter-street, London, E.C.

ELIGIBLE FREEHOLD BUILDING LAND, in the CITY of OXFORD.—The Guardians of the Poor of the Oxford Incorporation are about to OFFER for SALE, during the course of next Spring, the SITE of the present WORKHOUSE, in the City of Oxford, containing five acres or more. Further particulars may be obtained of W. JACOB, Clerk to the Guardians

Oxford, December 10th, 1863.

WOOLPIT, SUFFOLK.

WHITE and RED FACING BRICKS, and other Kiln Goods, at moderate prices.—Samples at T. ALLEN'S, 7, Great Smithfield-street, Westminster, or from Mr CAWSTON SLUTER, at the Works.—See R. G. BURNELL'S Report on Building Materials in "Mackenzie's Record of International Exhibition," p. 77.

TO BRICKMAKERS.—All Parties who BURN BRICKS in CLAMPS are invited to inspect the NEW MODE of SETTING, patented by Mr. ROBERT WHITE, and which may be seen in operation at the Brickfields of

J. B. WHITE & BROTHERS, Erith, Kent.

The advantages of this plan are two-fold.

1st. Nearly all the bricks are burnt into stocks, and the yield of inferior bricks is reduced from 30 to about 10 per cent. of the total make, which in itself represents a large permanent saving.

2nd. The bricks are so much improved in colour and soundness as to give them a considerable additional value in the market over common stocks.

Licenses for use of the Patent granted to Brickmakers, on application to the Patentees, 17, Millbank-street, Westminster.

BURHAM BRICK, LIME, and CEMENT COMPANY, BURHAM WHARF, BELVIDERE-ROAD, LAMBETH. NORWICH UNION FIRE INSURANCE SOCIETY

NOTICE CHRISTMAS RENEWALS

Mercantile and Dock Insurances at the reduced rates,

The Insurance Duty of 1½d. per Cent. is paid by the Company.

The duty paid to Government for the year 1862 was 85,062l and the amount insured on farming stock 10,615,382l

A bonus of three-fifths of the profits is annually made to parties insuring, who have thus from time to time received sums amounting in the aggregate to 440,000l., and the Society now holds a LARGE RESERVE upon which a future bonus is expected.

The rates of premium are in no case higher than those charged by the other principal offices making no returns to their insurers.

For prospectuses, apply at the Society's Offices, Surrey-street, Norwich; and 6, Crescent, New Bridge street, Blackfriars, E.C.

GUTTA-PERCHA MILL-BANDS.—The Gutta Percha Company beg to state that the increasing demand for the Gutta-Percha Driving Belts, Driving-bands, Lubricators, &c. fully justifies the strong recommendations they have everywhere received. Their durability and strength, permanent connection, and uniformity of substance; their non-susceptibility of injury from contact with oils, grease, acids, alkalies, or water, and the facility with which the only joint required can be made in bands of from one to 3 or 4 feet long, render them superior to leather for almost all working purposes, and decidedly more economical. Every variety of Gutta Percha Articles, such as Tubing, Soles, Pump-buckets, Elevator-belts, Beams, Piston-packing, Rollers, Buffers, Bands, Inlet-pipes, Curtain-rings, Galvanic Batteries, Tabloid-pie Trays, &c. &c. manufactured by the Gutta Percha Company, and sold by their Wholesale Dealers in town and country.

THE GUTTA-PERCHA COMPANY, PATENTEES,
18, WHARF ROAD, CITY ROAD, LONDON.

BY ORDER of the SECRETARY of STATE for INDIA in COUNCIL.

Notice is hereby given, that TWENTY FIVE APPOINTMENTS in the UPPER CLASS of the ELECTRIC TELEGRAPH DEPARTMENT in India will, in the year 1864, be open to PUBLIC COMPETITION.

A Competitive Examination will, accordingly, be held in this office in the month of MAY next. Full printed particulars of the conditions on which candidates will be admitted to the Examination, and also respecting the nature of the Appointments to be competed for, may be obtained at this Office, on application, either personally or by letter, addressed to the "Under Secretary of State for India," India Office, London, S.W.

November 20th, 1863.

THE ARCHITECTURAL MUSEUM, SOUTH KENSINGTON MUSEUM, W.
PRIZES FOR COLOURED DECORATION.

5l. 5s. and 3l. 3s. are now offered. The Competition will be open till MARCH 1st, 1864. Costs for colouration, price 5s. and full particulars may be had by letter to the Honorary Secretary, at 13, Stratford-place, W.

A. J. B. BERESFORD HOPE, President.
GEO. GILBERT SCOTT, Treasurer.
JOSEPH CLARKE, Hon. Sec.

All requests for Casts for Colouration must be accompanied by a Post-office Order on Charing-cross for 5s.; or if case and packing required, 7s.

PURSUANT to an Order of the High Court of Chancery, made in a cause "WILLIAM ROWE against EDWIN TIMPSON and Others," the Creditors of Mortimore Timpson, formerly of Shaftesbury-place, Hungerford-road, Middlesex, Builder, but late of the Victoria Tavern, Number 8, Crescent-place, Mornington-road, Middlesex, Licensed Victualler (who died on the 31st day of August, 1863), and also the Incumbrancers upon his Real and Leasehold Estates, are by their Solicitors, on or before the 31st day of JANUARY, 1864, to come in and prove their claims at the Chambers of the Vice-Chancellor Sir John Stuart, Number 12, Old Buildings, Lincoln's-inn, Middlesex, or in default thereof they will be peremptorily excluded from the benefit of the said Order. WEDNESDAY, the 27th day of JANUARY, 1864 at ONE o'clock in the Afternoon, at the said Chambers, is appointed for hearing and adjudicating upon the claims.—Dated this 9th day of December, 1863.

ROBT. W. PEARCE, Chief Clerk.
JOHNSON & MASTER,
22, Duke-street, Grosvenor-square, Solicitors for the Plaintiff.

NOTICE.

BROWN & GREEN'S KITCHEN RANGE WAREHOUSE is now REMOVED to the NEW PREMISES, 72—74, Bishopsgate street Within, a few doors from the late Address, at No. 81. These afford accommodation for a still larger stock of their Patent Prize Medal Ranges and Stoves, Register Grates, and Cooking Utensils, to meet the great public demand; and also for the consequent more extensive execution, by the manufacturers themselves, of all descriptions of hot water, bath, laundry, and steam work.

72—74, Bishopsgate street Within, November, 1863.

BILLING'S PATENTS.—CHIMNEY TERMINALS.—THROAT VALVES.—NOTICE to ARCHITECTS. The Proprietors of these PATENTS have given the Warm an Interest in the same, and have consiederably reduced the prices of the Articles, trusting that by so doing these useful Inventions may be introduced more generally in all new buildings. For prices, apply to the Manager, Mr. TYLER, 12, Abingdon-street, Westminster, who will also afford any information, he having been for many years engaged with the late Mr. BILLING, in the practical curing of smoky Chimneys.

CHATHAM HOUSE COLLEGE SCHOOL, Ramsgate.—The TERM for 1864 will commence JANUARY 28th. A Prospectus of Terms (which are moderate) and further information may be obtained of the Rev. the PRINCIPAL. Three Boys from this School passed the Senior Oxford Local Examination in June last, all of them in Honours.

CONTRACTS.

COAST GUARD CONTRACT.—NOTICE to BUILDERS and CONTRACTORS

Persons desirous of TENDERING for the ERECTION of a COAST GUARD STATION at Fleetwood, in the county of Lancashire, may inspect the Drawings at the Coast Guard Watch Room, Fleetwood, or at this Office, between the hours of TEN and FOUR, from MONDAY, the 21st day of DECEMBER to MONDAY, the 4th day of JANUARY, 1864 (now next ensuing, and both inclusive Sundays excepted).

Tenders to be sent to this Office not later than TWELVE o'clock at noon of the 5th day of JANUARY, under seal and directed to the Commissioner Controller General of Coast Guard, and endorsed "Tender for Fleetwood Coast Guard Station."

The Lords Commissioners of the Admiralty do not pledge them selves to accept the lowest or either of the tenders.

Dated this 19th day of December, 1863, in the Admiralty, Coast Guard office, 12, Spring gardens, London, S.W.

TO BUILDERS and OTHERS.—The Commissioners of Sewers of the City of London will meet in the Guildhall of the said City, on TUESDAY, the 19th of JANUARY next, at Half-past TWELVE o'clock precisely, to receive TENDERS for the CONSTRUCTION of NEW SEWERS, and Works in connection therewith, in Norwich-court (Fetter-lane), Jewin-crescent, and a portion of Jewin street, agreeably to plans and specifications to be seen at the Office of the Engineer to the said Commissioners, in the Guildhall. Security will be required from the Contractor for the due performance of his Contract. The Commissioners do not pledge themselves to accept the lowest Tender, or any, unless deemed advantageous; and no Tender will be received after TWELVE o'clock on the day of treaty.

By order, JAMES BUNSTONE DAW, Principal Clerk.

Sewers Office, Guildhall, 17th December, 1863.

VESTRY of ST. MARY, NEWINGTON, SURREY.—To BUILDERS and OTHERS.—The Vestry is desirous to have ERECTED a VESTRY HALL and OFFICES, in the Walworth-road, Newington, Surrey, and to receive TENDERS for that purpose. Persons desiring to submit such Tenders are informed, that they can see the drawings, specification, and form of contract, and obtain a copy of the bills of quantities, by applying to Mr. HENRY JARVIS, Architect, at his Office, No. 29, Trinity-square, Borough, Surrey, between the hours of TEN and FOUR o'clock. The Tenders are to be delivered at the Vestry-room, St Mary's Church, Newington, on TUESDAY, the 5th of JANUARY next, at SEVEN o'clock in the evening precisely, or previously thereto, at our Offices as below, and must be accompanied by a sealed envelope, containing the names of two proposed sureties in 500l for the due performance of the contract. The Vestry do not bind themselves to accept the lowest or any Tender

H. & F. CHESTER, Joint Clerks to the Vestry.

1, Church-row, Newington-butts.

THE MALVERN COLLEGE BUILDING COMPANY (Limited).—To BUILDERS. The Directors of the Malvern College Building Company are prepared to receive TENDERS for the ERECTION of TWO MASTERS' BOARDING HOUSES, at Malvern, on and adjoining the Proprietors' College, new in course of erection. The plans, specification, and bills of quantities can be seen at my Office, at Malvern or Clifton, from MONDAY, the 28th inst. until MONDAY, the 4th JANUARY next. Bills of quantities will be supplied, free of charge, on application to me, either personally or by letter. The Tenders to be delivered on or before ONE o'clock p.m. on MONDAY, the 4th JANUARY, 1864, to HENRY ALDRICH, Esq., Secretary to the Company, Orwell Lodge, Malvern, under the Tender for Boarding Houses." The Directors do not bind themselves to accept the lowest or any other Tender. Approved security will be required for the due performance of the Contract.

CHARLES F. HANSOM, Architect.

Rock House, Clifton, 16th December, 1863.

KEIGHLEY and WORTH VALLEY RAILWAY.—The Directors are prepared to receive TENDERS for the EXECUTION of the WORKS required in the CONSTRUCTION of the above RAILWAY. Plans, sections, drawings, and specifications may be seen, also schedules and forms of Tender obtained, upon application to J. McLANDSBOROUGH, Esq., Civil Engineer, 23 and 24, Queen-square, Bradford. Tenders are to be delivered as addressed on or before MONDAY, the 11th of JANUARY next, 1864. The Directors do not pledge themselves to accept the lowest or any Tender. By order of the Directors,

JONATHAN GILL, Secretary.

Oakworth, December 12th, 1863.

TO VALUERS.—POPLAR UNION.—Notice is hereby given, that the Assessment Committee of this Union are desirous of receiving TENDERS from Professional Valuers for MAKING a VALUATION of such Properties within the Union as may be required by the Committee. Two Tenders are to be jointly and severally from two persons (not connected in partnership), fully competent to value the Buildings of the Rateable Plant and Machinery; and such Tenders, stating the terms upon which it is proposed to make such Valuations, should be sent to me, addressed "Tender for Valuations," not later than the 4th day of JANUARY next. Parties Tendering are requested to be in attendance at a Meeting of the Committee, at HALF PAST ELEVEN a.m. on TUESDAY, the 5th day of JANUARY next. The Committee do not bind themselves to accept the lowest or any Tender.—By order of the Committee,

JAMES RIPLEY COLLINS, Clerk to the Committee.

December, 16th 1863.

TO BUILDERS and CONTRACTORS. The London Wharfing and Warehousing Company (Limited), are prepared to receive TENDERS for the ERECTION of THREE LARGE WAREHOUSES for the storage of Petroleum Oil, at their Wharf, at Purfleet. The drawings and specification can be seen at the Offices of the Company, where Tenders are to be delivered on or before THURSDAY, DECEMBER 31st. The Company do not bind themselves to accept the lowest or any Tender.

GEORGE MOONEY, Manager.

Offices, 6, Mark-lane, December 23, 1863.

CONTRACTS.

TO CONTRACTORS and OTHERS.—SEWERAGE WORKS.—The Local Board for the District of Ealing are prepared to receive TENDERS for the CONSTRUCTION of about 1,000 lineal yards of BRICK, and about 600 lineal yards of STONEWARE PIPE SEWERS, and other Works connected therewith, according to plans, specification, bills of quantities, and form of Tender, which may be obtained at the Office of the Surveyor of the Board, Mr. CHARLES JONES, 2, Church terrace, Ealing, on and after MONDAY, the 28th instant between the hours of TEN a.m. and FOUR p.m. Sealed Tenders to be delivered at the Office of the Surveyor of the Board, before NOON on the 6th day of JANUARY, 1864, endorsed, "Tender for Sewerage Works." The Local Board do not bind themselves to accept the lowest or any Tender. By order of the Board,

ALEXANDER HEMSLEY, Clerk to the Board.

23rd December, 1863.

TO BUILDERS.—Persons willing to CONTRACT with the Justices of the County of Kent for the ERECTION of POLICE STATIONS at Ashford and Sheerness may see the plans and specification at the Office of the County Surveyor, Maidstone any day, except Sunday, between the hours of TEN and FIVE. Each Station is to be Tendered for separately, agreeably to the form of Tender to be obtained at the County Surveyor's Office, where sealed Tenders, indorsed "Tender for Ashford Police Station," or "Tender for Sheerness Police Station," are to be delivered by TEN o'clock in the Forenoon of TUESDAY the 12th day of JANUARY next. No persons Tenders are to be in attendance at the Courts of Justice, Maidstone, at Half past TWELVE o'clock on that day. Another further sealed Tender will also be required and to be approved of in all particulars, and security will be required for the performance of the several Contracts.

By order of the Justices, A. WILDES, Clerk of the Peace.

Maidstone, December 17th, 1863

TO EXCAVATORS, ROAD CONTRACTORS, &c.—The Corporation of Reading are desirous of receiving TENDERS for the MAKING UP of about six acres of LAND, FORMING ROADS and DRAINS, ERECTING FENCES, and generally PREPARING the GROUND for the FAIRS of the Borough.—Plans and specifications of the Works may be seen at the Office of Mr. WOODMAN, Borough Surveyor, Reading. Tenders to be sent to the Town Office, and marked "Tender for Fair Ground," on or before SATURDAY, the 16th of JANUARY next. The Corporation will not be bound to accept the lowest or any Tender which may be sent in.

J. J. BLANDY, Town Clerk.

Reading, 14th December, 1863.

TO DUSTMEN, BRICKMAKERS, and SCAVENGERS.—The Crown Estate Paving Commissioners hereby give notice, that they are ready to receive TENDERS from persons willing to enter into CONTRACTS for the REMOVAL of DUST, DIRT, ASHES, and CINDERS, from the houses within the district under their jurisdiction in that respect for a period of one year from the 25th day of March next, 1864. Specifications and forms of Tender can be obtained on application to the Clerk. The Tenders, sealed and addressed to the Secretary to the Estate Paving Commissioners, and endorsed "Tender for Dust," are to be delivered here at or before THREE o'clock on WEDNESDAY, the 6th day of JANUARY, 1864.

FRANCIS ADAMS, Clerk to the Commissioners.

1, Whitehall place, Pall-mall, S.W., 18th December, 1863.

Printed forms of Tender will be supplied, and no Tender will be received unless in accordance with the instructions contained in the specification and conditions; and Parties tendering must be in attendance when their Tenders are opened. The Committee do not bind themselves to accept the lowest or any Tender. Particulars to be obtained on application to Mr. J. C. REYNOLDS, Surveyor to the Vestry, at the Office of Works, Wells street, Camberwell, between the hours of ELEVEN and THREE, on and after Tuesday, the 29th day of DECEMBER inst.

GEORGE WILLIAM MARSDEN, Vestry Clerk.

Vestry Hall, Camberwell, December 23rd, 1863.

TO BUILDERS.—WESTGATE CHAPEL, Heckmondwike.—TENDERS are required for the whole or any part of the WORKS in REBUILDING the CHAPEL now known as the "Lower Chapel, Heckmondwike. Drawings, specification, and conditions of Contract, may be seen on the Vestry Hall to present days from MONDAY, the 14th of JANUARY, next, to the SATURDAY following, both inclusive. Bills of quantities may be obtained, with the plans, on and after MONDAY, the 14th of JANUARY, 1864, application to me at my Office in Bradford, No. 16, Kirkgate. Sealed Tenders to be delivered to Mr. FRANK SYKES, of Cleckheaton, before ELEVEN a.m. on MONDAY, the 18th of JANUARY. The Committee will not be bound to accept the lowest or any Tender.

PAULL & AYLIFFE, Architects.

India Buildings, 20, Cross-street, Manchester,
Dated 22nd December, 1863.

TO SEWER CONTRACTORS and OTHERS.—VESTRY of ST. GILES, CAMBERWELL.—The Sewers and Sanitary Committee will meet in the Vestry Hall to receive TENDERS for the EXECUTION of SEWERS WORKS; comprising about 1,300 feet of brick sewer, 3 feet 9 inches by 2 feet 6 inches; and 600 feet broader, at 6 feet 6 inches by 6 feet; and 60 feet of 12-inch pipe sewer, to be laid down in Middle Peckham, Queen's road, Peckham, on TUESDAY, the 5th day of JANUARY, 1864, at HALF PAST TEN o'clock in the forenoon precisely. Printed forms of Tender will be supplied, and no Tender will be received unless in accordance with the instructions contained in the specification and conditions; and Parties tendering must be in attendance when their Tenders are opened. The Committee do not bind themselves to accept the lowest or any Tender. Particulars to be obtained on application to Mr. J. C. REYNOLDS, Surveyor to the Vestry, at the Office of Works, Wells street, Camberwell, between the hours of ELEVEN and THREE, on and after Tuesday, the 29th day of DECEMBER inst.

GEORGE WILLIAM MARSDEN, Vestry Clerk.

Vestry Hall, Camberwell, December 23rd, 1863.

[For remainder of Contracts see next Page.

CONTRACTS.

NOTICE to BUILDERS.—Persons disposed to TENDER for the ERECTION of the various WORKS intended to be erected by the Herefordshire and South Wales Agricultural Implement and Manure Company, may inspect the drawings and specifications at the Offices of the Engineer, Mr. THOMAS FLEWETT, C.E. 41, Tything, Worcester, on and after WEDNESDAY, the 23rd inst, up to MONDAY, the 28th, and after that day up to FRIDAY, the 31st, at the Office of JAMES JAY, Esq. Solicitor, Hereford. Bills of quantities will be supplied by the Engineer upon payment of one guinea. Tenders to be addressed to F. L. BADENHAM, Esq. Hereford, the Chairman of the Company, not later than MONDAY, the 4th day of JANUARY, endorsed, "Tender for Chemical Manure Works," after which day no Tenders will be received. The Directors do not pledge themselves to accept the lowest nor any Tender.

41, Tything, Worcester, December 17, 1863.

BRENTWOOD TOWNHALL COMPANY (LIMITED).—The Directors of this Company are willing to receive TENDERS for the ERECTION of a TOWNHALL, from the design of W. Bartlett, esq. The Directors do not bind themselves to accept the lowest or any Tender, and they will require the builder whose Tender is accepted to give the names of two sureties to be bound jointly with himself for the due performance of the work. The drawings and specifications may be inspected, on application to Mr. C. A. FIELDER, the Hon. Secretary of the Company, at Brentwood, and to whom all Tenders must be addressed, and delivered on or before MONDAY, the 11th day of JANUARY, 1864, endorsed "Tender for Building a Townhall, Brentwood."

December 19th, 1863.

TORQUAY HOTEL COMPANY (Limited).—To BUILDERS. The Directors of the Company will meet on SATURDAY, the 2nd day of JANUARY next, at the Royal Hotel, Torquay, at FOUR o'clock p.m. precisely, to receive TENDERS for the WORKS in ERECTING the new HOTEL at "The Cove." The detailed copies of the bills of quantities will be supplied to Builders, on application to Messrs. WILLIAMS & SCHOFIELD, No. 12, Montague street, Russell square, London, W.C. surveyors, upon depositing with them the sum of five guineas, which will be returned after the delivery of the Tenders. The Directors do not pledge themselves to accept the lowest Tender. The Builder whose Tender may be accepted will be required to find two sureties, to be bound jointly with himself, in the sum of £3000 for the due execution of the works.—By order of the Board,

E. N. CLIFTON, Architect of the Company,
17, St. Helen's-place, Bishopsgate street, London, E.C.

TO STONE-MERCHANTS and OTHERS.—Vestry of St. Giles, Camberwell.—The General Purposes Committee will meet on MONDAY, the 4th day of JANUARY, 1864, at FIVE o'clock precisely, to receive TENDERS from persons willing to CONTRACT with the Vestry for the SUPPLY of about 20,000 feet of 12 by 6 FURBECK KERBING, first-class quality, to be delivered at any of the wharfs or landing places on the Grand Surrey Canal within this parish. Further particulars to be obtained on application to Mr. J. C. REYNOLDS, Surveyor to the Vestry, at the Office of Works, Wellington-street, Camberwell, between the hours of ELEVEN and THREE, on and after the 28th DECEMBER instant. The parties Tendering must be in attendance when their Tenders are opened; and the Vestry do not bind themselves to accept the lowest or any Tender.

GEORGE WILLIAM MARDEN, Vestry Clerk.

Vestry Hall, Camberwell, 21st December, 1863.

FENDERS, STOVES, FIRE-IRONS, AND CHIMNEY-PIECES.

Buyers of the above are requested, before finally deciding, to visit

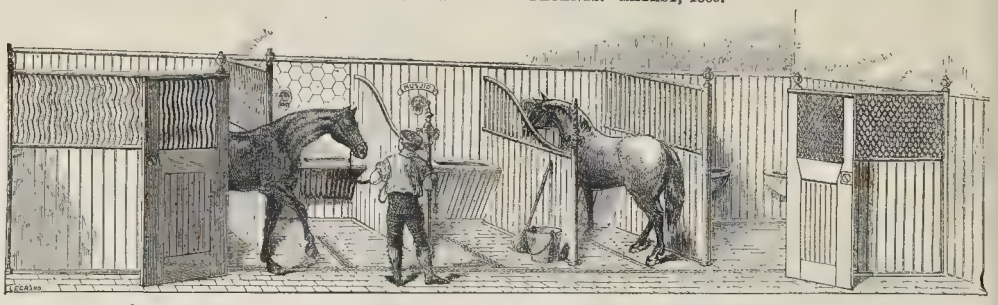
WILLIAM S. BURTON'S SHOW-ROOMS.

They contain such an assortment of FENDERS, STOVES, RANGES, CHIMNEY PIECES, FIRE-IRONS, and General IRONMONGERY, as cannot be approached elsewhere, either for variety, novelty, beauty of design, or exquisiteness of workmanship. Bright Stoves, with ormolu ornaments, 3*l.* 15*s.* to 33*l.* 10*s.*; Bronzed Fenders, with standards, 7*s.* to 5*l.* 12*s.*; steel Fenders, 3*l.* 3*s.* to 11*l.*; ditto, with rich ormolu ornaments, from 3*l.* 3*s.* to 18*l.*; Chimney-pieces, from 1*l.* 8*s.* to 160*l.*; Fire-irons, from 2*s.* 3*d.* the set to 4*l.* 4*s.* The Burton and all other Patent Stoves with radiating hearth-plates.

WILLIAM S. BURTON, GENERAL FURNISHING IRONMONGER,
BY APPOINTMENT TO H.R.H. THE PRINCE OF WALES,

Sends a Catalogue, gratis, and post-paid. It contains upwards of 500 illustrations of his illimited stock of sterling Silver and Electro-Plate, Nickel Silver, and Britannia Metal Goods, dish-covers, hot-water dishes, stoves, fenders, marble chimney-pieces, kitchen ranges, lamps, gaseliers, tea trays, urns, and kettles, clocks, table cutlery, baths, toilet ware, turnery, iron and brass bedsteads, bedding, bedroom cabinet furniture, &c. with Lists of Prices and Plans of the Twenty large Show-rooms, at
39, OXFORD-STREET, W.; 1, 1A, 2, 3, and 4, NEWMAN-STREET; 4, 5, and 6, PERRY'S-PLACE, and 1, NEWMAN-YARD, LONDON.

ST. PANCRAS IRON WORK COMPANY,



OLD SAINT PANCRAS ROAD, LONDON, N.W.

APPROVAL OF THE ROYAL VETERINARY COLLEGE.

THE MEDALS OF ENGLAND AND FRANCE,

And the Medals and High Recommendation of the Royal Agricultural Societies of England and Ireland.

SECURED BY EIGHT SEPARATE PATENTS. LATEST, 1863.

PATENT WROUGHT-IRON STABLE FITTINGS

SHOULD BE ADOPTED FOR THE FOLLOWING REASONS, viz.:—

That the BREAKAGES in Cast-Iron Fittings are numerous, and that one fracture from a kick, or other cause, may occasion an injury to a Horse, and involve a loss equal to the entire expense of fitting up the Stable. The fear of this has led to the use of wood, and, in the case of Cast-Iron GUTTERS, to the adoption of another and less effective mode of draining.

PATENT ENAMELLED TOP PLATE MANGER, with RACK & WATER-TROUGH,

The whole of which, except the Rack, being enamelled, can be kept as clean as a DINNER PLATE.

THE HALTER BALL, ATTACHED BY A NEW IMPROVEMENT, WORKS NOISELESSLY, AND ALMOST WITHOUT FRICTION.

PATENT FASTENINGS FOR THE DOORS OF LOOSE BOXES.

These Catches and Hangings work easily, are self-acting, and cannot be put out of order: by their use all projections by which horses are often blemished are rendered impossible; advantages peculiarly their own.

THE PATENT HARNESS FITTINGS

Keep the Harness and Saddles in shape, and are constructed so as to admit the air getting to the underside of them when hung up, thereby insuring a quick and perfect airing from any wet or moisture.

EVERY DESCRIPTION OF STABLE FURNITURE.

ILLUSTRATED LISTS ON APPLICATION.—INSPECTION OF SHOW-ROOM REQUESTED.

ESTABLISHED 1744.
AUSTIN'S IMPERIAL PATENT SASH and BLIND LINES.
To BUILDERS, CARPENTERS, and BLIND MAKERS.
J. AUSTIN, Manufacturer of the above articles, particularly wishes to direct the attention of the Trade to his
IMPERIAL PATENT FLAX SASH-LINES,
of which he is now making four qualities, and he strongly recommends that in all cases they should be purchased in preference to the PATENT LINES now made from Jute, which article has neither the STRENGTH nor DURABILITY of Flax, consequently cannot give so much satisfaction to the consumer.
They can be obtained of all Ropemakers, Ironmongers, Merchants, Factors, and Wholesale Houses, in Town and Country.

NEWCASTLE-ON-TYNE—Mr T. DUNN, IRONMONGER, GRAY STREET.
EDINBURGH—Messrs BELL & SON, IRONMONGERS, FREDERICK STREET.
BRIGHTON Messrs. LANGWORTHY & REED, IRONMONGERS.
Windows may also be seen at the Kensington Museum, London.

SIMPLICITY, UTILITY, ECONOMY, AND DURABILITY.

THOMAS PUGH & CO.'S NEW PATENT ECONOMIC SELF-ADJUSTING MORTISE AND RIM LOCK FURNITURE.

J. B. SCAMMELL & CO. (late Thomas Pugh & Co.)
WHOLESALE IRONMONGERS,
13, KING STREET, SNOW HILL, LONDON.

NUT PLATE.

We invite particular attention to the PATENT LOCK FURNITURE, which we do not hesitate to say is the most perfect article now manufactured, great improvements having been recently made in it. It has been extensively used in Public and Private Buildings, in Her Majesty's Pavilion and Camp at Aldershott—alone, many hundred sets without one single failure. It is applicable to all Locks and Latches, both Rim and Mortice, and effects a most secure fastening, without any screw in the neck of the knob. Perfect action guaranteed in both Locks and Furniture, if the Locks are of our own manufacture.

New rich Designs in Glass, China, Brass, Bronzed, Gilt, Carved Woods, Enamel, &c. &c. or to any Design.

THIS FURNITURE MAY BE HAD WITH PLATES OR NUTS.

A most complete and extensive stock of every description of Locks, Latches, Brass Foundry, and Ironmongery, required for Buildings, of the best quality manufactured, at the lowest wholesale prices.

*** Illustrations and Particulars sent on application.

WAREHOUSES FOR NAILS, PIPES, GUTTERS, &c. IN ST. JOHN'S COURT.

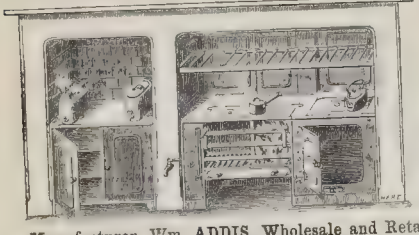
EXHIBITION PRIZE MEDAL, 1862, AND MEDAL OF ROYAL AGRICULTURAL SOCIETIES OF ENGLAND AND IRELAND.

MUSGRAVE'S PATENT STABLE and HARNESS FITTINGS.

MUSGRAVE'S PATENT HARMLESS LOOSE BOXES.
MUSGRAVE'S PATENT IRON COW STALLS and PIGGERIES.

Architects who have not seen these fittings are requested to write for engravings, as they are unlike those of any other maker, and were admitted to excel all the work of their class in the Exhibition.

They can be seen in first-class stables in almost every county in England; and MUSGRAVE, BROTHERS, are now fitting several very large establishments under direction of London architects, noted for employing only what is the best of its kind.



Musgrave's Patent Slow-combustion Stove

Is the fastest approach to Warming by Hot Water. It will burn in churches from Saturday till Sunday evening, without attention during the hours of worship. In halls will burn day and night for weeks, with little care. Capable of warming a large apartment for twenty-four hours, at a cost of 3d.; and deserving of special attention because of its safety, healthfulness, durability, and extreme simplicity.—For full particulars apply to

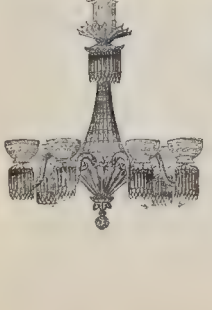
MUSGRAVE, BROTHERS, Ann-street Ironworks, Belfast.

CUNDY'S
PATENT BRICK OVEN WINDING CHEEK SEMI-CLOSE KITCHEN RANGE.

This RANGE, also
CUNDY'S PATENT BRICK OVEN
DOUBLE FALL-DOWN BAR KITCHEN RANGE,
AND
CUNDY'S PATENT COTTAGE RANGE.
Also CUNDY'S Patent Original Fire-Brick Warm Air Ventilating STOVE,
Suitable for CHURCHES, HALLS, SCHOOLS, and STAIRCASES,
Can be seen in operation daily at the SHOW-ROOMS of the

Manufacturer, Wm. ADDIS, Wholesale and Retail Ironmonger, Stove Grate and Range Manufacturer,
6, 7, & 15, LEICESTER STREET, LEICESTER SQUARE, LONDON.
A Prospectus, with full Description and Price of the above, will be sent per Post on Application.

COUNTRY ORDERS PROMPTLY EXECUTED.



All kinds of Smiths' Work.

J. MOORE,
WHOLESALE IRONMONGER,

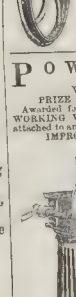
TO BUILDERS, JOINERS, CONTRACTORS, &c.



THE "GENERAL JOINER"

SAMUEL WORSSAM & CO having long felt the importance of introducing a LABOUR SAVING MACHINE, which by combining several operations at a moderate cost, should meet the requirements of builders and others engaged in the conversion of timber, beg to offer for this purpose their "General Joiner" as above, which in its present greatly improved form will, with 2 horse power, do the work of at least fifteen skilled joiners, in SAWING CROSS CUTTING, and SQUARING, PLANING, and THICKNESSING, MORTISING, TENONING, GROOVING, TONGUEING, RABBETING, BORING, BEADING, MOULDING, CHAMFERING, &c. &c.—For priced illustrated circulars, apply to S. WORSSAM & CO. Saw-Mill Engineers, King's-road, Chelsea (sole manufacturers), where the "General Joiner," and samples of the work may be seen.

PERIN'S PATENT

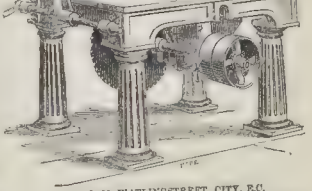
FRENCH BAND SAW BLADES.

SAMUEL WORSSAM & CO.

Having purchased of M. Perin, of Paris, the sole right to import and sell his BAND SAW BLADES throughout the United Kingdom, beg to announce that they are now in a position to supply these Saws from 1-16th of an inch to 3 inches in width, and up to 30 feet in length.

The vast superiority of Perin's Band Saws over any others in point of finish, toughness, durability, and evenness of temper, is now everywhere admitted.

S. W. & CO. keep a large stock of all sizes up to 2 inches wide, from which they can supply orders to any part of the kingdom within twenty-four hours' notice.



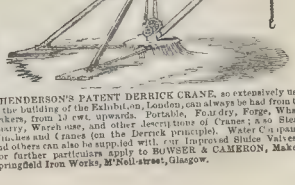
For Price Lists, apply to

SAMUEL WORSSAM & CO.
SAW MILL ENGINEERS,
304, KING'S ROAD, CHELSEA, S.W.

POWIS, JAMES, & CO.

SAW MILL ENGINEERS,
Victoria Works, Blackfriars road, London.
PRIZE MEDAL INTERNATIONAL EXHIBITION, 1862.
Awarded for a Collection of FIRST CLASS MACHINERY for WORKING WOOD, being the "HIGHEST COMMENDATION" attached to any medal in this class.

IMPROVED BENCH FOR GROOVING, REBATING, TONGUEING, &c.



OFFICE, 26, WATLING STREET, CITY, E.C.
where letters and applications for Machinery are to be addressed.

CHARLES POWIS & CO.

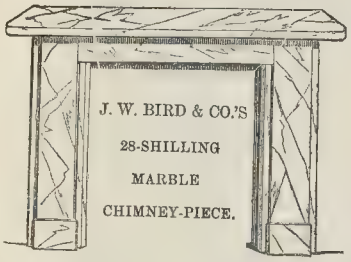
SAW MILL ENGINEERS, AND MAKERS OF CONTRACTORS' PLANT.
Cyclops Works, Millwall, Poplar, London, E.
From the experience of Mr. CHARLES POWIS, who was for so many years with Messrs. POWIS, JAMES, & CO., we are enabled offer SAW MILL MACHINERY and CONTRACTORS' PLANT upon very advantageous terms.
AGENTS WANTED. ENGINES ON HIRE.

HENDERSON'S PATENT DERRICK CRANE.—Prize Medal for Practical Utility and Moderate Cost.

HENDERSON'S PATENT DERRICK CRANE, so extensively used in the building of the Exhibition, London, can always be had from the Makers, from 10 cwt. upwards. Portable, Foundry, Forge, Wharf, Quarry, Warehouse, and other descriptions of Cranes; also Steam Winches and Cranes (on the Derrick principle). Water Companies and others can also be supplied with our Improved Sluice Valves.—For further particulars apply to BOWESER & CAMERON, Makers, Springfield Iron Works, M'Neil-street, Glasgow.

BATH STONE OF BEST QUALITY.

RANDELL & SAUNDERS, Quarrymen and Stone Merchants, Bath.



List of Prices at the Quarries and Depôts, also Cost for Transit to any part of the United Kingdom, furnished on application to BATH STONE OFFICE, CORSHAM, WILTS.

CARVED TRUSS STATUARY MARBLE CHIMNEYPIECE, 14-in. PIERS, FOR £6.

IMPORTANT TO ARCHITECTS, ENGINEERS, BUILDERS, RAILWAY, AND OTHER COMPANIES.

VIEILLE MONTAGNE ROOFING ZINC.

Company's General Agency, 12, Manchester Buildings, Westminster.

Zinc properly laid has been proved by most extensive and long experience in France, Belgium, and Germany to be a most secure, durable, and economical covering, and is now preferred to all other materials for roofs. Its extreme lightness makes it most valuable for covering buildings requiring large spans with comparatively light framing. On a rough calculation it may be estimated that not less than 41,000,000 square feet is the average quantity of Roofing surface now annually covered in the above countries alone. Within the last few years persevering efforts have been made to introduce into England proper workmanship, in accordance with the principles which are observed on the Continent, and which alone can secure the sound and perfect construction of a Zinc roof. To aid in extending as much as possible the knowledge of these simple rules, models showing all the details are to be seen in the Architectural Exhibition in Conduit-street, and the following, selected out of a very great number of recently constructed roofs, are referred to as examples:—The Patent Granary, West-India Docks; Copenhagen Works, Limehouse; a private house in Holland Park; Homes for Poor Merchants' Clerks, Muswell-hill; a large Warehouse, 77, Thames-street; Ship roof, Sheerness Dockyard; the Victoria Station, Pimlico; the Stations in the Metropolitan Railway; the Stations of the Madras Railway Company (400,000 feet); the Warehouse of Messrs. Oakes, Brothers, & Co. Madras (20,000 feet); the Refreshment Rooms at the Exhibition; the Verandah of the Horticultural Society's Conservatory; Gloucester Railway Station; Messrs. Horniman & Co.'s Tea Warehouse, Wormwood-street; Messrs. Hoare & Co.'s Brewery, Smithfield; Cape Town and Wellington Railway (60,000 feet); Fifty new Dwelling Houses at Palace Gardens-terrace, Kensington; Twenty ditto, Inverness-terrace, Bayswater.

Plans, Estimates, and all useful information will be furnished, without charge, by applying to either of the Directing Architects.

JAMES EDMESTON, 5, Crown-court, Old Broad-street.
R. G. FISHER, 12, Manchester-buildings, Westminster.

N.B. No covering can be more economical, durable, and secure than Zinc when well laid, but good Zinc badly laid will spoil the roof, and, with a view still further to encourage good work, a special Discount will be allowed to all persons upon the Zinc used in roofs, when certified by either of the above Architects to be properly laid.

HUBBUCK'S PATENT WHITE ZINC PAINT.

By their process, which is patented, pure Zinc Paint is Cheaper than White Lead. It does not change colour with the London atmosphere

ADULTERATIONS.—Some Paint Grinders have been selling Zinc Paint adulterated with Sulphate of Barytes from ten to thirty per cent. Whether sold under the name of "Improved Zinc Paint," or as the number Two or Three qualities, no workman can produce good work with such material. Workmen who have once used the Patent Zinc Paint will never willingly use any other Paint for their best work.

CHEAPNESS.—Not only is it cheaper per hundred weight, but two hundred weight of this Paint, with six gallons of oil covers as much surface as three hundred weight of white lead and twelve gallons of oil.

EACH CASK IS STAMPED "HUBBUCK, LONDON. PATENT."

THOMAS HUBBUCK & SON,
WHITE LEAD, OIL, PAINT, AND VARNISH WORKS, 24, LIME STREET, LONDON.

CHEAP, LIGHT, AND DURABLE ROOFING.

CROGGON'S PATENT ASPHALTE ROOFING FELT has been extensively used and pronounced efficient, and particularly applicable for warm climates.

1st. It is a non-conductor.—2nd. It is portable, being packed in rolls, and not liable to damage in carriage.—3rd. It effects a saving of half the timber usually required.—4th. It can be easily applied by any unpractised person.—5th. From its lightness, weighing only about 42 lbs. to the square of 100 feet, the cost of carriage is small.—6th. Under slate, metal, or tiles, it is a most effective non-conductor

CROGGON and CO'S PATENT FELTED SHEATHING, for Covering Ships' Bottoms, &c. and deadening Sound.

DRY HAIR FELT, for Covering Steam Boilers, Pipes, &c. preventing the radiation of Heat, saving 25 per cent. of Fuel,

INODOROUS FELT, for damp walls and for damp floors, under carpets and floor cloths. Price ONE PENNY per Square Foot.

Samples, testimonials, and full instructions, on application to

CROGGON and CO. 2, DOWGATE-HILL, London; and 2, GOREE PIAZZA, Liverpool.

Four doors from Drury-lane Theatre. Established in 1800.

The Builder.

VOL. XXI.—No. 1090.

"Going Along:" Milan.

UNDERFULLY changed and improved are the Milanese of late years. As compared with the Milanese of a dozen years ago, they are scarcely to be recognized. There is an air of life in the place. Men move about as if they were not afraid, and they have their views for the future. A great weight has been lifted off a growing plant, and it is springing up, relieved.

"To all men freedom solace gives:
He lives at ease who freely lives;
And he that aye has livèd free,
May not well know the misery,
The wrath, the hate, the spite, and all
That's compass'd in the name of Thrall."

Milan has always been elastic, even in very early time. In the month of March, 1162, after a resistance of three years, the Milanese yielded to the army of Frederick Barbarossa, and the emperor commanded that the houses, as well as the walls of the town, should be razed to the earth, and that one stone should not be left upon another. With the exception of the church of Sant' Ambrogio and a few other buildings, everything in consequence appears to have been destroyed. It was soon after this that the League of Lombardy, of which we spoke in Vicenza, came upon the ground, and the militia of the united towns set themselves to restore the walls and revive the city. The peace of Constance, in 1183, secured to the Italian republics their rights. The city of Milan soon rivalled its former self, and for a couple of centuries things went on tolerably smoothly. Then came its ambitious dukes, the Viscontis, and afterwards, in 1450, its subjugation by Francesco Sforza. However, never mind just now its troubles and its varieties of fortune. At the present moment Milan rejoices and moves on. Great improvements are to be made in the city; notably a grand *place* in front of and about the cathedral, —*Piazza del Duomo*,—a new street, named after the King, opening out of the piazza to a monument to Leonardo da Vinci, and on the other side of the piazza, opposite the new street, a "*Loggia Reale*" and monumental fountain, with general re-arrangements of the streets about. The scheme is by the architect Mengoni, of Bologna, and was approved of by the communal council in September last. If carried out worthily, it will greatly improve the city.

The works for the completion of the cathedral, that marble wonder, go steadily on. The persistency and skill with which this object has been pursued are most honourable to the Milanese. The building belongs to the present as well as to the past. All know the appearance of the White Marvel, its forest of pinnacles and population of statues, as they do also the outline of its history. It was founded in 1386, by Jean Galeazzo Visconti, Duke of Milan (a scoundrel of eminent ability), in fulfilment of a vow made to the Virgin.* He seems to have been fond of offering bribes to a higher power: he had made a vow of pilgrimage to a certain shrine near the Lago Maggiore, when, a few years before the date we have named, this same noble duke trepanned his uncle Barnabas, imprisoned and ultimately murdered him. The name of the architect of the cathedral is doubtful; Marc de Campione, and other members of the same family, are named by some Italian writers, but the evidence seems most in favour of Heinrich Ahrler, a German. The building itself shows the architect could not have been an Italian.

The original design appears to have been pretty well adhered to by a long list of architects and sculptors who succeeded Ahrler until Pellegrino Pellegrini, beginning in 1567, went about to complete the west front in the Italian style. This was not persevered in, fortunately; but his doors and windows were preserved, and destroy the oneness of the structure. Some day, we have no doubt, these will give place to features more accordant: such an alteration is often talked about. The works had lingered just before the French obtained dominion in Milan, but Napoleon I. sent them forward, and since then they have continued to progress more or less briskly. The view on the marble-covered roof, putting out of sight a horribly ugly bell-tower which is coming down, is marvellously striking. The outline of the great pinnacles is for the most part satisfactory, though the detail of portions is not so. The marble brattishing on the top edge of the flying buttresses has on each point a flower or fruit, the tulip, pomegranate, rose, and so forth, greatly varied. The engraving we give of a couple of the pinnacles and a portion of the parapet will convey a notion of the character of the work to those who happen not to know it. The statues on the pinnacles are 6 feet in height. Many of these, as well as the figures in other situations, the work of the best Italian sculptors, are admirable productions. There are now actually some 7,000 statues about the building, and 3,000 more are wanted to complete the intention. Sixty-four have been put up during the present year; and within the last twelve years, 2,400. A large number of artists, as may be supposed, mostly Lombards, are kept at work upon them. One turret which was finished in 1859, has 100 statues about it, and cost 20,000*l*. The marble, let us say, in addition to these striking statistics, comes from quarries, near the Lago Maggiore, with which the cathedral is endowed. Every part is finished with great care and stands soundly.

The effect of the interior on first entering is truly grand. The loftiness of the nave, 153 feet; the enormous size and height of the columns, with statues under canopies all round the top of each as a capital, dividing the nave from its double aisles; the glowing morsels of glass seen here and there at the extreme east end; and even the painted tracery in the groining, till the deception is found out, aid in producing this. The pulpits round the pillar on each side at the commencement of the choir, carried on terminal statues, are seen in every picture of this interior. The figures under the southern pulpit, by Francis Brambilla, are especially good. According to an inscription in another part of the edifice, dated 1599, this Brambilla worked forty years for the cathedral. Of the rich contents of the edifice, in the shape of sculpture, metal-work, and painting; the mausoleum of the good St. Carlo Borromeo; or the goldsmith's work and curiosities of the Treasury, we must not attempt to speak. Of the two fine monolithic columns of red granite at the entrance, about 32 feet in height; the tomb of Jean Jacques and Gabriel Medici, supposed to be from a design by Michelangelo; and the statue of St. Bartholomew without his skin, by a sculptor who modestly warns spectators not to suppose it a work of Praxiteles, every one knows.

St. Charles Borromeo, whose name is specially connected with this cathedral, and whose body is gazed at by every curious visitor to it, was one of the best men of his period, or, indeed, of any period; and before he died—prematurely, at 46,—effected an extraordinary amount of good, and left a reputation that cannot be attacked. Unselfish, clear-headed, vigorous, and possessing the charity tha covereth a multitude of sins,—in others,—he spent his life in doing good. He founded colleges schools, and hospitals throughout his immense diocese; tended his flock during a visitation of the plague; reformed his clergy, instituted Sunday-schools; and in such works, and on the poor, spent the whole of an enormous income, derived partly from his private estate and partly from the archi-episcopal revenue. The memory of such a man is sweet. An inscription against the east wall, behind the choir, records the consecration of the cathedral by this good Charles Borromeo, in October, 1577. The high-altar had been previously consecrated by Pope Martin V. Above the inscription are the large eastern windows, filled with stained glass, which seemed to us more satisfactory at a distance than when close. In our volume for 1861,* by the way, a plan of the cathedral will be found; introduced with special reference to the continuation of the aisle, here, around the eastern apse. The modern glass in the building, of which there is a considerable quantity, some of it beautiful, is by J. Bertini, of Milan, for whom the credit is claimed of having revived the art. He died in 1849. A tablet to his memory, at the east end, is inscribed,—*Joanni Bertinio, qui artem picturæ vitro incoquendæ ferme interceptam restituit, auxit, perfecit*, &c.

From the cathedral we go to the theatre,—so accident led us,—to the theatre of La Scala, which, moreover, has a connexion with the church not obvious at first sight. The pious Beatrice, a daughter of Mastin de la Scala, Lord of Verona, aided in rebuilding an old church, which was afterwards called in her memory Santa Maria della Scala. Circumstances caused its suppression; and on the site, in 1776, was built the theatre known all over Europe as "La Scala." The family name of the foundress given to a church thus survives in a playhouse. A grand and complete theatre it is, with its six tiers of boxes and accommodation for about 4,000 spectators; or, when arranged for a ball, 7,000;—in fact, the finest in the world. Piermarini, a pupil of Vanvitelli, of Naples, was the architect, finishing it in 1778; but Canonica rearranged and improved the stage portion in 1814. The prevailing colour is white, with gold. The Royal box is in the centre of the house. The State contributed to the erection of this theatre, and still contributes to its maintenance. The orchestra accommodates ninety-one musicians, sometimes ninety-five; and beneath it is an open chamber called the *chambre harmonique*, about 5 feet in height, formed with wood, and thought to improve the effect of the music. The stage has a depth from the front of the orchestra of 140 feet. Mr. Fergusson, not measuring an available apartment at the back, thrown into the stage by an opening nearly as wide as the proscenium, calls the depth but 77 feet. On the stage 400 persons can be placed conveniently for action. Indeed, the *Prophète* has been given here with 500 persons on the boards. There is a subsidized School of Dancing,—we will not call it dancing school,—connected with the theatre. It was instituted in 1813, and has produced pupils of wide fame. People sometimes regard it as astonishing that while a small Italian state can produce fine dancers England does not do so. They might almost as reasonably be surprised at finding flowers in a garden where seed had been carefully sown, and no flowers in another where that step had not been thought necessary.

The finest Gothic church in Italy and the finest theatre are strong claims for Milan; and to these may be added the most striking Lombard Atrium; the finest piece of ninth-century goldsmith's work in the world; the handsomest internal

* An inscription at the east of the cathedral inside says,—"*El principio dil domo di Milano fo nel anno* 1386."

* Page 675, Vol. xix.

court, that of the Ospedale Maggiore; Leonardo da Vinci's *chef-d'œuvre*; and one of the best pictures painted by Raffaelle the Divine, hight the Sposalizio. Of these, however, —"Anon! anon! sir."

The atrium, of course, is that of Sant' Ambrogio, one of the most interesting buildings to be found, erected probably quite at the beginning of the ninth century, on the site of a church built by Ambrose, Bishop of Milan, in the fourth. It has a gallery (triforium) over the main arches in nave, but no clerestory. The size of the church is large; the arches are all semicircular, with the exception of the vaulting of the nave, introduced at a later time. Considerable repairs to the internal stonework of the east end of the building are being made, apparently with proper care for the old work. At the end of the nave, and in front of the apse that terminates it, stands the celebrated metal altar-casing, under its Lombard baldachino, the latter comprising four porphyry columns, and a considerable amount of very interesting carving in the canopy these carry. The altar-facing, however, is *the* thing to be seen, and though the priests in charge of it *show* no great anxiety to fetch the keys and remove the wooden covering always kept over it, for which the fee is five francs, it is but coyness that a little persistence will overcome. Examples of metal-work of the ninth century are very rare, and this *palliotto* is of a beauty and an excellence rarer still. It was executed in the year 835 by order of Angilbert II., and is thus inscribed on the back by the maker, "Vvolvini' Magist. Phaber;"—master smith. Simple as the inscription is, no one of the books that we happen to have before us gives it literally. The cost of this work is said to have been 80,000 florins of gold. The front, entirely of that metal, is in three main panels, divided and sub-divided by borders of enamels. Christ in the centre of a cross in the middle panel, the twelve apostles in sub-panelling on each side, bas reliefs, filagree work and precious stones are its chief features. The ends and the back are of silver, enriched with gold, and display, especially the back, even finer work than the front. Enamelled borders divide panels containing medallions and bas reliefs as in front. In one of the medallions St. Ambrose is represented as blessing the artist. Both design and workmanship of this production of the "dark ages" are exquisite. Where could we now look for a man to give us such a work of the nineteenth century to compete with this master-smith's handiwork of the ninth?

The vaulting of the apse is covered with early mosaic work, strong and black, put up in the time of the Carlovingian Emperor Louis II., who was contemporary with our Alfred the Great. He died young, in the year 877, and was buried in this church. The mosaic picture includes large figures of the Saviour and several saints, on a gold ground; the style, of course, Byzantine. All the principal workers in mosaic appear to have been Greeks of the lower empire till the time of Cimabue and Giotto, whose successors substituted for the severity and hardness of the old work, grace and finish, and refined it away till it became powerless.

The atrium was added to the church, says Gally Knight, by Bishop Anspertus, who died in 882, and Knight quotes the epitaph which was on his tomb, proving that he did build it; but this does not show there was no atrium before. It has a fine large arcade of brick and stone, with capitals and archivolts beautifully sculptured with interlaced work, foliage, and animals. Hosts of tablets, ancient remnants, and inscriptions are affixed to the walls: a walk in it is delightful.

In the gallery attached to the Biblioteca Ambrosiana, the earliest really public library in Europe, and altogether a fine institution, is the Cartoon of Raffaelle's School of Athens,—amazingly grand even in this shape. There are, too, some remarkable heads by Bernardino Luini, a copy of a grand Crucifixion, by Guido Reni, one of those pictures that take hold of you; and an immense number of sketches by Michelangelo, Albert Durer, Raffaelle, Leonardo da Vinci, and others,—especially, however, by Leonardo, whose drawings include all sorts of subjects, full of fun and caricature. The immense amount of work done by Leonardo da Vinci, Raffaelle, Paul Veronese, Rubens, and other of the greatest artists, is amongst the things to wonder at. Certain it is that those who have done the best work have usually done the most. There is a tablet on the staircase here, put up in 1637, in memory of Leonardo da Vinci,—truly a universal genius.

However, enough of endeavour to master, of wonder and delight, of envy and depression, for once. The sun has gone down, and we get a refreshing and charming drive round the outside of newly-enlarged public gardens, and on the ramparts, now transformed into pleasant shady green avenues for riding and walking. Many beautiful equipages are about; new buildings in progress, some ornamented externally with terra-cotta, are observable; and everywhere we see signs, and delight in seeing them, that Milan is moving. Thunder and lightning, illuminating strangely the needle-like termination of the central tower of the Duomo, close the drive, and send us back to the comfortable Albergo Reale, with an "effect" to talk about.

THE CIRCUMSTANCES OF CELEBRATED MEN.

We write mindfully of the great aim of human existence when we choose the word celebrated, instead of great, to distinguish those who have distinguished themselves in the fine arts, sciences, and literature. Few of us can hope to become celebrated; but all of us may be great in a wise and self-abnegating acceptance of the several circumstances assigned us, and a faithful determination not so much to seek our own honour and glory, as to be of service to our fellows. A certain degree of excellence in our several pursuits is, however, the lawful ambition of all: and they who have attained this will be the first to admire the works of those whose genius has carried them still further. There may be a posthumous celebrity in store for many who are now labouring unmarked by their contemporaries: for the judgment of posterity is just; and if work be truly excellent, yet not admired or acknowledged in our generation, we may entertain the hope that those who come after us will appreciate it. We have numerous instances on record of cases where the contemporaries of those whose memories we delight to honour thought but little of the individuals in question or their respective performances when living, besides the well-known instance of the poor price paid for Milton's peerless "Paradise Lost;" and, on the other hand, many artists and writers who enjoyed a reputation while living have now faded from public recognition. Celebrity should not be esteemed too highly; for, like great riches, it is not always awarded to the most worthy; but we may rest assured that the rewards promised to crown a patient continuance in well-doing will be shared only with the just. And, after all, the applause of the world is but as a feather blown hither and thither on the downs compared to the satisfaction of having conscientiously filled our measure of good works. It may be thought that we are methodically turning over and spreading out our laid-up platitudes to air upon a paper beach; but when the galaxy of bright names we are about to group together are discerned, it will be seen that some such indication of the direction of the right path through the forest of endeavour was imperative. To be dazzled by the results of a few picked lives amidst the thickets of industry would be to be lost.

The standard of excellence varies in height and quality according to the proficiency, acuteness, and critical fastidiousness of the person by whom it is viewed: that which one mind might consider mediocrity, another would accept as perfection; and a degree of superiority that may be deemed very admirable by many, would be utterly rejected by others. Among the uncivilized, for example, warriors only would be esteemed great; and as an instance of the extent to which some men of genius have carried the last-mentioned exclusiveness, we may refer to David Hume, who declared he could only assign first-class places in the ranks of science to two philosophers, Galileo and Newton; nor could he place more than two English poets, Milton and Pope, in the same prominence. In our present examination of the circumstances which assisted or impeded the progress of celebrated men, we do not affect to exercise so rigid a rejection. We throw widely.

It is a generally received opinion that men of genius have been indebted to their mothers rather than to their fathers for any portion of their abilities that may have been hereditary. In the acceptance of this opinion, we are more gallant than correct. The Basires, engravers, present one of a string of examples we might thread in which a particular talent was handed down from father to son, and thence to grandsons. James and John Bernouilli, mathematicians, with the son, Daniel, and grandson, John, of the latter, all of European celebrity for their scientific attainments, might be placed on the same list; as might, also, the instance of Thomas Gale, author of the inscriptions on the Monument, and his sons Roger and Samuel, all of whom were antiquarian writers of eminence. The father of Raffaelle was a painter; the father of Mozart, a musician of no mean distinction, being vice-chapelmaster and composer to the Prince Archbishop of Saltzburg; Cuyp was the son of a painter, as was also Paul Potter: Bernard Picard, the engraver, author of "The Religious Ceremonies of all Nations," was the son of an engraver; and Nollekens, the sculptor, was the son of an artist. The two Pitts, father and son, in recognition of the same description of talent—statesmanship—were, with an interval of twenty-eight years, both accorded the distinction of a public funeral: the great Earl of Cork and his sons, grandsons, and great grandson, present a succession of four generations of literary and philosophical talents entailed in the male line: the Mylnes, architects; the Darwins; the Sheridans; the Burneys, father, son, and daughters; the Edgeworths, father and daughter; the Herschels, father, son, and grandson; the Stephensons, are further instances we might cite. The son of Cibber, the sculptor, proved a poet and dramatist, and his grandson also handled dramatic subjects; and although there was a variety in the professions followed by these three generations, they all called for genius of an imaginative order. The younger Matsys, painter, had for a father Quentin Matsys, and for a mother the daughter of a painter: Lucas de Heere, who painted the portrait of Darnley, husband to Mary, Queen of Scots, Lady Jane Grey, and other historical personages of his time, was the son of a statuary and Anne Smyters, a miniature landscape painter: the father and mother of Vandyke were both painters. In these instances it would, perhaps, be difficult to distinguish the parent from whom the son inherited his genius. We would not, however, appear desirous of detracting from a full and free acknowledgment of the great influence the female parent must possess, both congenitally and educationally, upon her offspring; and gladly admit that there are many indisputable cases on record of celebrities who could have owed their genius to no other source. The mother of Sir Walter Raleigh had two husbands; yet the sons of both possessed the same love of roving adventure and gift of authorship: Sir Humphrey Gilbert distinguished himself as much as Sir Walter Raleigh: he accompanied his half-brother in some of his voyages, wrote a discourse to prove the practicability of a north-west passage, and took possession of Newfoundland in 1583. But we must suggest that the former examples we have mentioned prove that the sons of men of high orders of intellect have frequently inherited the genius of their fathers.

When we look across the fields of Time at the hosts of talented men who have earned the privilege of arraying themselves beneath the title "celebrated," we are fain to admit that it would be impossible to classify the circumstances that result in the development of extraordinary faculties. The examples we have quoted of celebrities who have entailed upon their sons abilities of the same *genre* as their own merely negatives the assumption that the rich inheritance is always the gift of the mother: there is a much larger group who must have found their powers within themselves, as men, sometimes, in new countries, find gold when they are *prospecting* for baser metal; consequently the supposition that genius, as a rule, is affected by parentage, falls to the ground. Nor does it appear that we should be justified in assuming that the employment of the parents in any way directs, or otherwise assists, the sons in coming more easily at results that make them famous. Although Mademoiselle Rosa Bonheur, the princess of painters, may be the daughter of an artist, Turner was the son of a barber; Albert Durer, of a goldsmith; Gains-

borough, of a clothier; Barry and Romney, of builders; Sir Joshua Reynolds, of a clergyman. There is scarcely a trade or profession but can boast of being the cradle of men of unusual mental attainments; and in some instances the same branch of industry can point to various sons who have excelled in the most opposite pursuits. Clerks of works may claim Chaucer as a *confrère*; besides several celebrities of less note, of whom we may particularize John Norden, topographer and engraver, who was surveyor to Prince Henry, the amiable and much-regretted son of James I.; and John Joshua Kirby, clerk of the works at Kew, who taught perspective to Queen Charlotte and her royal children, and was the father of the gifted Mrs. Sarah Trimmer, some of whose writings were dispersed by the Society for Promoting Christian Knowledge. Gardeners may point to the Tradescants of one century, and Allan Cunningham of the next. Butchers may urge that the materialism of their calling has not precluded them from rearing sons of the most imaginative intellects, such as Akenside, Defoe, and Kirk White; or of the most consummate political ability, as in the example of Thomas Wolsey. It is deemed likely, too, that the father of Shakspeare turned butcher when his fortune changed. Dr. Isaac Watts and Chatterton were the sons of schoolmasters. Booksellers will rejoice over Dr. Johnson; watchmakers over John James Rousseau; shoemakers over Hans Christian Andersen, than whom no one has written more graceful or charming fairy tales for children: hatters will deem their annals relieved by the name of W. Collins, poet; chandlers by that of Benjamin Franklin; distillers will think of Wilkes; drapers of Isaac Barrow, the mathematician and instructor of Newton, and of Alexander Pope; jewellers of Francis Grose, the antiquary, Sir Samuel Romilly, and others. The Church has been most prolific of gifted sons; indeed, the longest clue towards a classification of the circumstances that have resulted in the unfolding of latent genius consists in the fact that clergymen have been the parents of more celebrities than any other class of men; but whether this is due to the liberal education persons of that rank of life would be sure to afford their sons, or to the, always, settled and, generally, ample means of the parents, which would give them leisure to discern and then direct any indication of unusual powers in their offspring, or both these advantages combined with the first-class intellectual discipline that men in the position from which the ministers of the Church are chosen have been subjected to, as well in their own person as in that of preceding generations, and those that may be expected to accrue from the first-class sanitary conditions under which country clergymen are enabled to bring up their families in their large, detached, roomy parsonages, is matter for further conjecture. Poets, painters, architects, engineers, dramatists, antiquaries, essayists, and mathematicians, have been reared in vicarage-house nurseries, as well as theologians. The present poet-laureate, the tuneful Tennyson, is the son of a Lincolnshire clergyman: Mr. G. G. Scott, architect, was born at Gawcott, in Buckinghamshire, of which parish his father was then incumbent: Mr. Scott Russell is the son of a Scottish clergyman: Mr. Frederick A. Paley, author of "A Manual of Gothic Mouldings," "The Church Restorers," and numerous architectural works, is the son of a clergyman, and grandson of the celebrated author of the "Evidences of Christianity:" Addison, not yet displaced from the topmost place in the ranks of English essayists, although it is nearly 150 years since he sent for Lord Warwick to Holland House to show him how a Christian could die; Cowper, the poet-moralist; Atwood, the mathematician, whom Pitt so much admired as to provide with a sinecure at his earliest opportunity, that he might be able to pursue his learned labours and financial calculations at leisure; the victorious Nelson, Lysons, the elder Paley, Richard Wilson, painter, and Sir Joshua Reynolds, were alike the sons of clergymen. Richard Cumberland, the dramatist, was the son of the Bishop of Clonfort: Fletcher, the associate of Beaumont, was the son of the Dean of Peterborough who attended Mary, Queen of Scots, at her execution: Farquhar, another dramatist, author of the "Beaux Stratagem," was the son of an Irish clergyman; and every one will remember that Sir Christopher Wren was the son of the Dean of Windsor and nephew of the Bishop of Ely. The law, too, may look around upon a numerous progeny of celebrities. The present President of the Royal Academy, Sir Charles Eastlake, is the son of a solicitor: Dean Swift was the son of an attorney; Wordsworth, of a law agent, at Cockermouth; Quin, the actor, of a barrister. But it is a curious fact that great lawyers have generally been the sons of men engaged in dissimilar pursuits, as witness the cases of Lords Eldon, Stowell, and Lyndhurst. The army has furnished its quota of celebrated men who have closed their ears to the merry fifes and drums, and their eyes to the scarlet coats and gold lace epaulets of their fathers, and betaken themselves to other walks in life. Lawrence Sterne (alas! poor Yorick!) was the son of a lieutenant; David Garrick, the tragedian, of a captain: Sir Richard Steele, entered the army before he established the *Tatler*. The son of one of the contributors to the *Tatler*, by the way, Arthur Henley, became Earl of Northington and Lord Chancellor. The first president of the Institution of Civil Engineers in Scotland, W. J. Macquorn Rankine, is the son of a lieutenant in the army. The Government offices have given us a few able men, of whom, perhaps, Adam Smith, son of a comptroller in the Customs, and author of the learned "Inquiry into the Nature and Causes of the Wealth of Nations," stands first. A physician gave us one of our grandest musicians — Handel; and one of our most humorous rhymesters, Peter Pindar, was brought up as an apothecary. A money scrivener, whose natural progeny might have appropriately proved a miser, gave us the genius whose fire has ignited the fancy of all cultivated intellects, in proportion to the approximation of their brilliancy to his, for a couple of centuries—Milton; and as if to show that this was not a solitary case to remain without a parallel, a member of the same dry, hard-fisted profession was the father of the poet Gray. Banks, the sculptor, and Locke, the author of the thought-teeming essay "On the Human Understanding," were both the sons of stewards. The fathers of three acknowledged geniuses of very different orders have been barbers—Arkwright, whose name is associated with the spinning-jenny for evermore; Turner, whose glowing palette may be said to be scarcely yet dry; and Falconer, the writer of the most popular of sea poems. The two other children of the elder Falconer were deaf and dumb, a fact that presents another insurmountable difficulty in the acceptance of the theory of the hereditary nature of genius. Again, the younger Falconer, throwing off all the trammels that association with the business carried on in the poor little shop in Edinburgh might have fostered, struck out for the sea with an instinct as unquenchable as that of a duckling bred under a hen; while men whose parentage alone would have qualified them, to some extent, as authorities upon sea-going subjects, looked landwards for their livelihood, founded their fame where the roar of the ocean was unheard, and the flicker of a seagull's wing unseen. Guy, who was the son of a lighterman, set up a bookseller's shop, and amassed the splendid fortune that laid the foundation of that great charity, Guy's Hospital. Had this man followed his father's occupation, would he have proved a jolly, rum-drinking, money-spending Jack Tar, and died with nothing in his pocket save a broken pipe and a screw of tobacco?

An inquiry into the truth of the proposition that the boy is father to the man would bring forward some interesting particulars. Perhaps it would be more literally true to write the youth is father to the man; so large a number of our celebrities having been placed to learn trades and professions of a totally different character to those to which they ultimately turned their attention, and in which they afterwards pre-eminently shone. This must have been in consequence of their boyhood having failed to unfold any decided bent in their minds. It may have been that the poverty of the parents of Giotto opened out no other prospect than that of tending sheep as a means of livelihood to the incipient painter. But poverty bound no fetters on the hands of Howard, the philanthropist, who listlessly suffered himself to be bound apprentice to a grocer. That there was not the least necessity for such a step we learn from his biographer Aikin, who relates that he had an independent fortune, and, that growing tired of his position, he purchased his indentures and made the tour of France and Italy, visited Lisbon, and ultimately turned his attention towards ameliorating the condition of prisoners in the improvement of prisons. Dollond, the optician, wrought patiently as a silk-weaver; and Goddard, who enjoyed the credit of being the first Englishman who made a telescope, must have studied hard and continuously as a physician to have won the post he filled of Professor of Physic to Gresham College. Opie, the painter, was apprenticed to a carpenter: Tom Payne learnt the business of a stay-maker, a branch of industry in which it is difficult to account for his acquirement of principles so reverse of tight-laced as those he disseminated in after life. Gay, the poet, was apprenticed to a silk mercer, and died the pampered pet of a duke and duchess, and was buried in Westminster Abbey. Inigo Jones was apprenticed to a joiner. Kent, the architect, was a coach painter. Garrick embarked in the wine trade before he turned his thoughts to the stage, in the same desultory manner that Mr. Buckstone, comedian and dramatist, in our day, first sighed for a sailor's life, and then acquiesced in being articled to a solicitor. It is known, too, that Mr. Charles Mathews made his first appearance in the character of a student of architecture. Anthony Purver, who received a thousand pounds from Dr. Fothergill, for his new translation of the Bible, was apprenticed to a shoemaker, who allowed him the occasional relaxation of tending his sheep. Ben Jonson was apprenticed to a bricklayer, and then enlisted for a soldier before he set up as a wit-combatant with Shakspeare, and fell out with Inigo Jones, who was associated with him in the production of the fanciful court masques of his day; and before he was a member of the club Sir Walter Raleigh founded, and wrote that song, "Drink to me only with thine eyes," that lies like a loose pearl among his more lengthy works. James Cook, the navigator, instead of running away to sea like another Robinson Crusoe, was apprenticed to a small country shopkeeper, who, however, detecting the wistful glances the lad cast towards the ocean, returned him his indentures. As a reverse to this example, enacted within remembrance, Clarkson Stanfield, R.A., went to sea instead of turning his steps straightway to a studio. Mr. Charles Dickens and the younger Disraeli both mistook their road on first setting out in life, thinking a lawyer's office lay in their right paths. Barry Cornwall fell into the same error. Mr. Thackeray likewise lost his way at first, and tarried in Rome, studying as an artist. David Roberts, R.A., climbed the ladder that led to his present elevation from the level of a house-painter's apprentice, with an interval of noviciateship spent as a scene-painter in Drury Lane Theatre. Mr. Ruskin coquetted with the brush before he took up the pen, as vigorously as Bishop Colenso attacked algebra before he distinguished himself as a theologian. Could we linger to cull more instances of these "wanderings by the way," from the lanes and byways of memory, where they crowd as densely as daisies upon a clay soil, we doubt not but that our revision of the time-honoured metaphor would find general acceptance.

Some worthies, whose works are sufficiently esteemed by us to render their authors memorable, have never laid aside the pursuits they learned as lads, however foreign they may have proved to their after sympathies. The author of "Parentalia,—or, Memoirs of the Family of Wren," and of "Typographical Antiquities, being an Historical Account of Printing in England, with Memoirs of our Ancient Printers,"—Joseph Ames, who was besides a collector of coins, curiosities, and books, carried on the business of a shipchandler and ironmonger in Wapping to the day of his death. It was not until Isaak Walton was fifty years of age that he left London, where he had kept two shops for the sale of linen, the first in the Royal Exchange, the second at the corner of Chancery-lane, Fleet-street,—to settle at Winchester. For thirty-three years Charles Lamb fulfilled the duties of a clerk at the East-India House, when he was pensioned off. Samuel Rogers was a banker all the days of his life. But it must be admitted these instances of what may be called the duality of being are comparatively scarce; eminence in any one department of art, science, or industry, calling, generally speaking, for an intense concentration of mind, purpose, and energy to the one aim. It is true, Benvenuto Cellini, Leonardo da Vinci, Michelangelo, Raffaelle, and a few others, were at once eminent in several branches of the fine arts; but these were giants of intellect and manipulation, whose existence is as exceptional as the longevity of the "old, old, very old" Parr and his grandson. That the world is not now altogether barren of similar versatility, we were apprized by an advertisement in an Australian newspaper, in which notice was given that fourteen persons were wanted to fill the various appointments held by a gentleman recently deceased; and we have more serious assurance of the same fact when we call to mind the names of Mr. Charles Knight, printer, publisher, and voluminous and excellent author; Mr. J. R. Planché, "Rouge Croix" and antiquary, and author of 200 stage plays; Mr. Tom Taylor, dramatist, and Secretary of the Committee of

Privy Council appointed to carry out the Local Government Act; Mr. Coventry Patmore, poet, and one of the officers of the British Museum; Mr. Sydney Dobell, wine merchant and miscellaneous writer; Mr. Chas. Swain, poet and trader, and others.

Much more might be said both for and against the theory that talent is hereditary; and the more the subject was turned over and examined from different points of view, the more impossible it would be found to arrive at any conclusions. For there have been as many instances of descent of talent on the paternal side as there have been on the maternal side; perhaps nearly as many instances where isolated genius stands out from a family group that is physically and mentally imperfect; as many where a brother and sister divide the intellectual powers of a family circle between them, as in the case of Miss and Mr. Martineau, N. P. Willis and his sister, the younger Thomas Hood and his sister; or when two brothers have shared the gift, as in the examples of the brothers Brough, Grimm, Mayhew, Horace and James Smith, Sir Robert and Sidney Smirke, Wilkie Collins and his brother, &c.; or two sisters, as in the instance of Mrs. Hemans and her sister, Sophia and Harriet Lee, the Hon. Mrs. Norton and Lady Dufferin, &c.; and others again where a whole family are gifted. As a fresh puzzle thrown into the question from an ethnological point of view, we may add that the father of the most brilliant of French novelists, Alexandre Davy Dumas, was the son of a negress by the Marquis de la Pailleterie, a wealthy West Indian planter.

In reviewing the lives of celebrities, some of our readers may feel discouraged that they have failed when so many have more or less succeeded who have had, seemingly, greater difficulties to encounter than those that have beset their own paths. They whom this consideration might cause to falter by the way would do well to remember that the multitudinous works compassed and difficult parts enacted by those whose names have become known, occupied a whole lifetime, although we look at the result in one glance. Those who prepare a feast, although unseen and unknown, are indispensable to the host who presides over it; and if they be not invited to the table they will be rewarded in some other manner. Milton, in allusion to his own blindness, wrote a talismanic consolation to myriads of his fellow-creatures:—

> "God doth not need
> Either man's work, or his own gifts; who best
> Bears his mild yoke, they serve him best; his state
> Is kingly; thousands at his bidding speed,
> And post o'er land and ocean without rest.
> *They also serve who only stand and wait!*"

STREET NOMENCLATURE.

It may occur to some persons that a subject apparently so unimportant as the naming of streets is undeserving of serious consideration, and it may perhaps seem superfluous for me to trouble you again with some remarks concerning it; but I think, on review, that it will be seen that it is a matter that affects us much more closely than we are accustomed to imagine. "Could I unfold," says Carlyle, as quoted by Miss Yonge, "the influence of names, I were a second Trismegistus. They are the most important of all clothings: science, poetry itself, if thou consider it, is but a right naming. Adam's first task was giving names to natural appearances." We have the testimony of Mr. Shandy, as related by his son, that "a great deal more depends on names than what superficial minds are capable of conceiving. How many Cæsars and Pompeys, he would say, have by the inspiration of their names been rendered worthy of them; and how many would have done exceedingly well in the world had not their characters and spirits been totally depressed and *Nicodemus'd* into nothing!" An illustration of the influence a name may exert even upon a street lately occurred in my neighbourhood, where a street was named Benjamin-road by the freeholder; but the houses not letting as quickly as they should, the builder changed the name to Clifton-road, when he speedily found tenants for his houses.

Hood, in his history of "Miss Kilmansegg," dwells with great point and humour on the importance of names in describing her christening, where he says,—

> "Though Shakspeare asks us, 'What's in a name?'
> (As if cognomens were much the same),
> There's really a very great scope in it.
> A name?—why wasn't there Doctor Dodd,
> That servant at once of Mammon and God,
> Who found four thousand pounds and odd,
> A prison—a cart—and a rope in it?
> A name?—if the party had a voice,
> What mortal would be a Bugg by choice?
> As a Hogg, or a Grubb, or a Chubb rejoice?
> Or any such nauseous blazon.
> Not to mention many a vulgar name
> That would make a door-plate blush for shame,
> If door-plates were not so brazen."

And the modern Solomon, the many-editioned Tupper, exhorts parents, with emphasis, to—

> "Give a child a fit distinguishment, make him sole
> tenant of a name,
> For it were a sore hindrance to hold it in common with
> a hundred.
> In the Babel of confused identities little is feasible.
> The felon shall detract from the philanthropist,
> And the sage share honours with the simple."

These quotations, though referring to the names of persons, apply with scarcely less force to the names of streets: "in the Babel of confused identities little is *findable*" to slightly vary the poet's text: the fortune of a street frequently depends upon its title, as we have seen; and what a constant source of embarrassment it is not to be able to ascertain by the name of a street its position or importance, through the present indiscriminate application of names. As an example of the confusion arising from this latter cause, I may instance the use of the word "gardens," as applied to localities. Until quite recently this term was only used for blocks of houses inhabited by the poorer classes, and generally entered by a narrow passage-way, as Dobney's (a corruption of D'Aubigny's) gardens, Short's-gardens, &c., the houses having been built upon the gardens belonging to noble families, whose possessions had been gradually encroached upon by the growth of the metropolis: the frontage having been first invaded, and the space within being thus inclosed, was let for an inferior class of houses to those around. Now, however, the term is used for the handsome rows of mansions that are springing up in Kensington and the neighbourhood; and though the two descriptions of houses have nothing in common except their name, an absurd and incongruous association is kept up in consequence.

I need scarcely point out the absurdity of calling these rows of houses "gardens," when frequently they have nothing more than a yard in the rear, and a paved road in front; but would merely observe, that on comparison the poorer houses have really a better claim to the title than their richer brethren; for whatever may be their present condition, they may at least boast of occupying a site—

> "Where *once* a garden smiled."

This abuse of terms is really a great evil, and calls for redress. Every thoroughfare aspires to the dignity of being called a *road*, and the term *street* is falling into desuetude. We have *parks* without a tree, tortuous *avenues*, and names used for streets without any consideration as to their fitness, but merely for the purpose of increasing their importance. In Paris attention has been drawn to this subject: "the use of the word 'square,' which had been adopted from the English, will be discontinued, and that of *place* in future applied to all open spaces, whether planted as gardens, like the ground before the Arts et Métiers and around the Tower of St. Jacques, or left entirely open. . . . . The use of the word *boulevard* will be circumscribed, and should only be applied to roads which follow the line of ancient fortifications or old municipal boundaries. The wide thoroughfares which traverse the city in an oblique direction, or run from the centre to the circumference, are in reality *avenues*: the designation *boulevard*, as applied to some of the transversal thoroughfares recently opened, will be retained." These are sensible reforms, and proceed on a proper principle; but I cannot but regret, at the same time, that the term *barrière* (where no longer existing, I suppose) will be abandoned, together with *route, chemin, sentier, allée*, and *chaussée*. Each of these has a distinctive meaning; and although in many instances they have lost their significance, it seems a pity to obliterate these old landmarks of the progress of the city. *La Route de Neuilly* has a pleasant sound, and carries one's thoughts away from the streets and traffic; and such names as *La Rue de la Basse Rempart*, now obliterated, although in the midst of the city, served to remind one (like our own London Wall and Barbican) of the once limited extent of the capital.

Instead of suppressing ancient names, I would advocate their retention in all cases, and would even suggest that we might with advantage revive many of the old designations which have now fallen into disuse, and feel sure that were they used with proper discrimination the result would be much more intelligibility in our streets, and a much more exhilarating impression on the mind than is produced by the present monotonous promiscuous system. In Naples the principal streets are called *strade*, the cross streets *vichi*; the smaller streets *vicoletti*; the lanes *strettole*; the hilly streets leading to the old town, and up to the castle, *calate*; those leading to the suburbs, *salite*; those that are so steep as to require steps, *gradoni*; those which have many branches, *rampe*. Here we have a number of suggestive names, which agreeably vary one's walk, and assist one in finding the way. At Milan, the streets which radiate from the centre of the town are called *corsie*; the continuations of these beyond the line of the most ancient fortifications are called *corsi* (a distinction almost without a difference), and beyond they receive the name of *borghi*,—*borgo* being the Italian equivalent for suburb. The streets, in many places, which run parallel to, and immediately within, the canal, retain the name of *terrazzij* or terraces. There can be no mistaking the class of streets referred to by these names, and this system combined with a uniform method of numbering, would simplify addresses, and save a great deal of labour in every department of trade.

In my former communication I suggested giving names to streets indicative of their locality. This has been very amusingly carried out by a builder in Islington, who lately applied to the vestry for leave to name three new thoroughfares Trajent (*sic*), Adrian, and Antonine roads, and the required permission was granted amid much laughter. These high-sounding titles are very ridiculous, and were adopted evidently without any consideration, merely because the roads are on what is called the Roman-road Estate. It is not unlikely that there was once a *castra æstiva*, or summer camp, at this place, and Suetonius Paulinus is said to have encamped in the neighbourhood; but there is no more connexion between the locality and the Roman emperors whose names have been evoked than there is between a river in Macedon and a river in Monmouth, which are in about the same concatenation accordingly.

The *Athenæum* lately protested against the embankment of the Thames being called Thames-Embankment-street, as it is threatened; still less Metropolitan-Board-of-Works-thoroughfare, or Thwaites's-road; and suggested that the proper English name is Thames-way or Thames-bank. It may seem, as the writer allows, a little like counting our chickens before they are hatched, but it is nevertheless a timely and serviceable caution, and the name proposed is simple and appropriate, although Thames-bank (as Major Jackman observed of Miss Wozenham's lodgings), certainly "smells of coal-sacks." The name of the new street to the Mansion House is not yet determined on, and there was a very amusing competition in the House of Commons between the City and the Metropolitan Board of Works, for the honour of standing sponsor to the new thoroughfare, the privilege being, however, on the intercession of the Premier, reserved to the Metropolitan Board, by whom the works will be carried out. It is to be hoped, as Mr. Crawford remarked in the course of the discussion, that that distinguished body will refrain from giving the street the name of one of their members, as they have done in some cases; and that no petty rivalry between the City and the metropolis will prevent an appropriate and distinguishing title being given to this great metropolitan improvement.

It is very important that the names of streets should be conspicuously written up; and the want of this is very noticeable in some parts of London, particularly in the suburbs, where such assistance is most required. By the Metropolis Local Management Act of 1855, the duty of providing and affixing these names was assigned to the Metropolitan Board, and some progress was made in this direction; but by the amendment of 1862, the obligation was cast upon the various vestries and district boards, and the consequence has been a very irregular system of naming, and, in some cases, almost entire neglect of the provisions of the Act.

The Metropolitan Board should exercise some supervision in this matter, and should enforce uniformity in the labels, lettering, &c. A great deal might be effected by a judicious selection of colours in the labels, and some regard should be had to appearance as well as legibility. The labels are made without any regard to their destination, and some very ugly results ensue, which might be easily obviated by a little forethought.

John Hebb.

Architectural Association.—The paper "On the Building Act" is to be read on the 7th, not the 17th, as stated: and District Surveyors are invited to attend and take part in the discussion.

ANCROFT CHURCH AND PELE TOWER.

IF we wanted confirmation of the opinion that the tide of change flows but slowly northwards, we might find it in the hilly, heathery, furzy, mossy, stony country, scantily speckled with small grey towns and thatched villages, known as North Northumberland. Here, in this apex of old England, are to be found manners, customs, and idioms that were in vogue three lifetimes ago in the more southern counties, and old words in use that have faded from Southern vocabularies these hundred years. The spinning-wheel is not so long disused but that it yet finds a corner in many a homestead: stores of homespun linen are still the hoarded pride of every thrifty wife; hand-knitted hose the daily wear of young and old; and porridge the morning meal of many a cottager in North Northumberland. In the extreme north of Scotland still less change has been effected: the Scots are even now making the same uncouth pottery the Celts made with us nearly two thousand years ago. The several races that have, however, passed over Northumberland since that period have each left it more and more advanced in every art; but it would not be averring too much to say, that in the hilly district of the county, where there is no railroad, where traffic is scanty, and the farmhouses few and far between, Queen Victoria's subjects may see the mode of life of the liege of the early Georges. Cottage-doors standing open in outlying villages reveal glimpses of carved oak cabinets and chests Queen Elizabeth might have been proud of, and precious pieces of china on cottage mantel-shelves show how little North Northumberland has been explored.

VIEW OF ANCROFT CHURCH AND PELE TOWER.

The region to which we refer lies beyond the wall —"the wonderful work of wall stones"—built by the Romans to keep the Picts out of their newly-acquired territory, and forms an irregular triangle, containing about ten hundred thousand acres, in the extreme North of England. It has been the site of Celtic and Roman, of Saxon and Danish, of English and Scottish warfare; and subsequently, down to the days of the Pretender, of intermittent intestine strife; and there are remains in stones or memories in words of all these periods to be found in it. Ancroft church is situate on its eastern border. This division, cultivated and fertile, compared with the mountainous western division,—alternately green, yellow, white, and brown, as seed time and harvest are succeeded by frost and Plough Monday,—is bounded by a rocky shore which is lashed and laved by the North Sea. Small fishing villages break the coast line,—groups of low stone houses full of lines and hooks, water-proof clothing, and little children,—in the neighbourhood of which boats and linen lie sunning on the sands with the sea-weeds. And in the glittering sea, two, three, four, and five miles from the shore, are the Farne and Staple Islands, with deep heavy fringes of wet sea-weeds clinging to them. Along this same coast-line, too, stand Warkworth, Dunstanborough, and Bamborough Castles, sentinels that have seen centuries of service. A little to the north of the last-named fortress, the ruins of Lindisfarne Priory rise out of the sea on Holy Island. To this once famous establishment Ancroft belonged.

In our recent account of Northumbrian peles we mentioned this curiosity of architecture. On examination of the view we present, it will be seen that the structure was originally a Norman chapel, as the records of the monks of Lindisfarne, preserved in the library of Durham Cathedral, show it and the fabrics of other chapelries belonging to the priory to have been. The Scots were constantly ravaging the possessions of the prior. The account rolls of the priory frequently show that they laid the country side waste, and that the income of the monks was seriously affected by their depredations. The religious houses in the district all possessed strong towers of defence; and probably the monks of Lindisfarne were obliged to take the same precaution for the safety of their tenants and property at Ancroft. Whether this supposition be correct or not, on the west end of the church, we may see there was built, in Edwardian times, a low square pele. The rest of the structure has been repaired from time to time, with not much appreciation of its archæological interest; and the interior of the pele has been plastered and whitewashed; but these facts scarcely account for the circumstance of this massy relic, so reminiscent of border raids and rescues, having been hitherto undervalued.

The local histories, directories, and gazetteers, make but meagre mention of Ancroft. They merely see and note an ancient edifice with an ancient tower, "presenting more the appearance of an old castle than a church." They agree as to the fact of a company of army shoemakers having resided in the village in the reign of Queen Anne; and all think it probable that Ancroft was formerly of more importance than it is at present, a belief that is founded on the circumstance of the foundations of old houses having been uncovered, in a field close by, within remembrance. It is situate on the high road between Berwick and Wooler—a town of one street of low stone houses, environed with mountain scenery, enjoying a reputation, among invalids, for goats' milk. The living, which is a perpetual curacy, was once entered upon the king's books as being of the certified value of 17*l.*, then augmented in 1773 with a donation of 40*l.* from Bishop Crewe's trustees, and now valued at 131*l.*, in the gift of the dean and chapter of Durham.

Church towers in all countries have been used as places of safety in occasional instances; but in Northumberland the towers of some churches appear to have been built expressly for the purposes of defence. This would have been more especially the case where there was no pele. The Early English tower of Long Houghton Church was the substitute for a pele to the neighbouring inhabitants. In 1567, Clarkson, when making a survey of the Earl of Northumberland's possessions, writes of Long Houghton Church thus:—"The chirch and steple of this towne is the great strengt that the poore tenants have to drawe to in the tyme of warre, wherfor it wer neadfoull the same be for that and other causes kepid in good reperations and therunto the parisheyners be alwaise straitly commandit and request maide to the qweynes maie'ts officers for the reparyng of the chansell so often as need shall require." There is an instance of a tower being built in the midst of the domestic buildings of an abbey at Hulne. It was placed close to the "great chamber," into which an entrance was made. It is in good preservation, although the rest of the buildings are in ruins: this is in some measure due to repairs made by the first Duke of Northumberland. There is a peculiarity about this tower worthy of notice. It is of three chambers in height, the lowest of which is vaulted. Above the leads covering the third chamber is raised a small apartment, which was known as the "Studye howse." This was finished with a battlement, as was the tower generally. Hulne was founded by William de Vesci, Lord of Alnwick. When the ancient Percies became possessed of the barony, they continued the good offices of the founder, and extended the privileges of the fraternity of Carmelites established there. It was a Percy who built the monks the tower in question as we may read in an inscription they placed on a wall at Hulne:—

> "In the year of Christ Jhu MCCCCLXXXVIII.
> This towr was bilded by
> Sir Henry Percy,
> The fourth Earl of North-
> umberland of great honor
> and worth,
> That e-spoused Maud the
> good lady full of vertue
> and beauty,
> Daughter to Sir William
> Harbirt, noble and hardy
> Erle of Pembroke, whose
> soulis God save
> And with his grace con-
> serve the builder of this
> towr."

HOLY TRINITY SCHOOLS, HORTON.—MR. ASHPITEL, F.S.A., ARCHITECT. *See p.* 910.

We have given but a bare outline of the part of the country in which Ancroft is situate. Those who would fill in the picture of North Northumberland must put a purple tint upon the Cheviot hills in the distance, and a grove of fir-trees waving mournfully like funeral plumes on Flodden hill. In the foreground they may place figures wading ancle-deep in trout-streams, or trudging knee-deep in heather with guns across their shoulders, or tending flocks with glittering fleeces on the sun-and-cloud-chequered hills as they choose. They must add, too, piles of grey ruins and green mounds covering up masses of masonry that defended brave men, from men as brave, hundreds of years ago; the eddying of wild birds, the scamper of hares from cover to cover, the rustling of tasselled pine-trees drooping with brown and ruddy cones, a colouring of sea-green lichens upon wall stones, and withal an indication of peace and leisure as ineffable as though Time had laid down his scythe and was resting himself.

NEW SCHOOLS, HOLY TRINITY, HOXTON.

These schools are now nearly completed, and are intended to accommodate between 600 and 700 children,—boys, girls, and infants. They are designed on the principles recommended by the Committee of Council on Education. The boys' schools are together nearly 100 feet in length, with two large class-rooms; the girls' school nearly 90 feet, with one class-room. The lower story is 14 feet high in the clear; the upper, 16 feet. In addition to the usual means of ventilation and supply of fresh air, there are separate air-flues in contact with the chimneys, which, being heated by them, will form a species of "sucking shafts," to exhaust the vitiated air imperceptibly in winter, when the cold renders it difficult to keep ventilators open. Other sanitary requirements have been carefully attended to.

One novel feature will be added to the building. It is that of a drinking-fountain, accessible to the public as well as the children, and in that crowded neighbourhood it is hoped will prove a great boon.

The architect is Mr. Ashpitel: the builders are Messrs. Carter, of Westminster. The amount of the contract is 1,687*l.*

THE BELGIAN REPORTS ON THE EXHIBITION OF 1862.*

The capital one of all the many defects in the management of the Exhibition of 1862, was the omission of reports, or records, adequate and proportionate to the value, in the points of view related to future progress, of the works and specimens that were collected together. We have already shown that this defect has rendered the preliminary efforts of the Commission and the exhibitors in England, in the main barren of results. We looked to some of the commissions, however, for reports more creditable to the foreign countries for which they were made, than are generally those reports of which the publication was undertaken by the Society of Arts, but has not yet been, we believe, completed. In the results of the labours of the French Commission we were not disappointed; and the six volumes which appeared in Paris, at the close of the Exhibition-year itself, were lately reviewed by us in an article wherein we mentioned also papers by professors of the Conservatoire des Arts et Métiers, and the reports of the workmen delegates.† The reports last named seem to be still in course of publication.

We trust that the organization of the Exhibition of 1865 in Paris, and of our own commission on the occasion, will be such that due justice may be done to the opportunity; but, this will require not only good classification of subjects on paper, but an arrangement of the articles much better than that of 1862, and space greatly increased. The Palais de l'Industrie, as we said in our former article, will be quite inadequate; and any number of *annexes* for which there is ground in and near to the Champs Elysées, would we fear not make up the ample space, the want of which was destructive to the Exhibition of 1862. In short, the space must be ample, in order that there may be classification, and freedom for the appreciation of objects. Without this, the opinion to which M. Michel Chevalier was tending in his report, as to the future impossibility of organizing Great Exhibitions, had better be taken as the correct and conclusive one.

We have now before us, the first volume of the documents and reports of the Belgian Commission of the Exhibition of 1862. This instalment seems to promise that the entire series will be worthy to rank with the French reports, or those which the Austrian Commission are understood to be about publishing. The present volume indeed takes us only so far as the end of the report on Class IX., "Agriculture;" therefore it does not include some sections nominally devoted to architecture and building, or to manufactures connected therewith. But, it includes classes for raw materials and products, the *matériel* of railways, and machinery and tools. The first hundred pages and more, of the volume, repeat publication of the documents which appeared in the catalogue specially appropriated to the division,—as the royal decree constituting the Belgian Commission, and the different regulations, including those by the English Commission; and they give an account from the *Moniteur Belge*, of a ceremonial on the 26th of September, 1862, when various honours were distributed, or announced as conferred upon exhibitors, artisans and workmen, and workwomen, foremen of industrial schools, and agricultural labourers—nearly two hundred altogether; the whole being wound up with the nominations and promotions in the order of Leopold.

On the installation of the Commission, it was decided that the expenses of carriage and arrangement should be undertaken by the Government; and the Chambers thereupon allowed a credit of 225,000 *francs*. To that they added in 1862, 100,000 *francs*. This, in the English value of French *francs*, would make the whole 13,000*l.* Early in the Exhibition-year, complaints similar to those of the French, were made by the Belgians, as to the insufficiency of the space allotted them. In the section of fine arts, it was found that the space was only half of that given to Belgian artists in the French Exhibition of 1855. It is right that all the difficulties should be taken into account, before assuming each department of such an exhibition to be *representative* of its country or class. In the section of fine arts, however, the Belgians managed affairs eventually well. A jury of admission was appointed, composed of nine members. Of these it was originally intended that four should be named by a majority of the artists who had sent in demands to be allowed to exhibit. But the scheme failed. Out of 228 artists, seventy only voted. Those voted for comprised a very large number of names. Ultimately, the Commission appear to have been unable to find four men who had received a majority of votes, who would accept office; therefore they requested the Minister of the Interior to name the jury of selection, which he did, taking gold-medallists, and others who had been similarly distinguished on occasions of exhibitions; the gold-medals in Belgium, it seems, being granted by juries partly elected by the artists themselves.

The chief industries of which the Belgian Commission had to regret the inadequate representation, were those of agricultural implements, of manufactures in iron and zinc, of furniture, of articles in flax, and of mixed stuffs. The value of the collection of minerals has been referred to in one of our notices; and a most interesting collection of appliances, testified to the attention which is given to education in Belgium. As to objects of this latter class, alone, it is to be regretted that efforts of promoters of the Exhibition of 1862 have resulted in the preservation, or so as to be readily accessible, of little of what was brought together.

Belgium, as a country, and a state, is now particularly deserving of study, apart from its interest as one of the great fields of the exemplification of art in architecture, and its heritage of history. The coal extracted, which was 3,228,000 tons in 1838, became 9,611,000 in 1860; the products of the metal-works which in the former year represented a value of 52,600,000 *francs*, attained in the latter, one of 129,700,000; whilst the power of steam-engines, which was that of 25,312 horses, had reached at the end of 1860 that of 161,809 horses. The exportations which were, between 1836 and 1840, about 141 millions of *francs*, became in 1860, 470 millions. Between 1846 and 1858, the exported products of the glass-works increased 132 per cent., the exports of iron-castings 179 per cent., those of machinery 202 per cent., and those of zinc 291 per cent. The population increased 25 per cent. from 1830 to 1860, or from 118 persons per square *kilomètre* to 160 persons, the difference being due not only to the increase of births but to the greater duration of life.

The address of M. Fortamps, the president of the Belgian Commission, on the occasion to which we have alluded, mentioned these facts. But it also referred, though in terms less emphatic than the reports of the French Commission, to the "immense progress realized in England, since 1851, especially in the fabrication of objects that borrow from form an element of success;" and said that Belgium should march in the same way. It recognized, however, the merits of some of the Belgian manufactures, in point of art. But M. Fortamps added, concerning taste united with excellence of workmanship:—"Let this study of the beautiful applied to the useful, spread more and more amongst the masses; let it be facilitated by schools of industrial design, museums of models, popular libraries, in a word with all that can raise the level of the genius of our populations, so laborious, and so active."

Comparisons between the systems of government in Belgium and France, suggest themselves frequently in the proceedings of the ceremonial. Thus, the Minister of the Interior says in his address, that the name of *octrois* will be soon forgotten in Belgium.

The same minister referring to the point of taste, says that reproach against the Belgian section in 1862, if to be made, would have been qualified had manufacturers to whom he alludes, not refrained from exhibiting. Nevertheless, he admits, there is "serious progress to accomplish in the application of art and science to the production of objects of industry." But, he continues,—"Already the Government has laid the bases of professional, scientific, and artistic instruction: the academies of fine arts, the schools of design, the industrial schools, the model-workshops, and the special schools of weaving, offer their lessons to artisans and workmen who wish to initiate themselves in the knowledge of the beautiful, or acquire technical information. This instruction will shortly receive new developments by the aid of the local administrations," &c.

The report on Class I., "Mines and Metallurgy," is by M. A. Devaux, Inspector-general of Mines, Belgium, who was vice-president of the jury. Some of the chief passages of this report relate to models and objects exhibited in the Belgian division in the Western Annexe. Some of these were so placed that they were but little noticed. Amongst them were models illustrative of Belgian improvements on the system of well-sinking, or boring, employed by M. Kind at Passy, Paris. Most Artesian borings have been undertaken, like those in the desert in Algeria, for the supply of water; but boring has also been largely used in the search for coal in the north and east of France. In Belgium, however, there have been no Artesian well or boring works so considerable as those in France. The modification of Kind's system, which is by Chaudron, is said to have great value, not only from its economy, but from its offering perhaps the only method in certain conditions. The description by the reporter, of the systems of Kind and Chaudron, required illustrations. The want of these generally, in the volume is to be regretted.

The report on Class II., "Chemical Substances and Products, and Pharmaceutical Processes and Products," by M. J. T. P. Chandelon, has received more attention than some others in the volume, although Belgium did not contribute much in the class. The plates all relate to it. In it will be found particulars of the manufacture in Belgium, of white of lead, and ultramarine.

Class III., "Alimentary Substances," is reported upon by M. E. Jacquemyns.

Class IV., "Animal and Vegetable Substances employed in Industry," is the subject of an able report by M. J. S. Stas. It gives information concerning products used for artificial lighting, glue, and different other materials. The information respecting the different oils, as petroleum or parafine, is full and useful.

Class V., "Locomotives and the Material of Transport and Way," is reported upon by M. F. Spitaels, who found the chief improvements exemplified in details. He discovered a general tendency to the substitution of steel for wrought iron in the locomotives and other rolling stock. The employment of this material allowed weight to be diminished, and more useful effect to be produced. The reporter calls the attention of his government to the fact that the prescribed thickness of boiler-plates takes no account of quality of the material, notwithstanding that the manufacture is greatly improved. In the Exhibition of 1855, even, he says that Messrs. Jackson, Brothers, Petin, Gaudet & Company, exhibited a boiler of cast-steel. They offered it to the French Government to be experimented upon, and a commission was appointed, with a view to determine what reduction of thickness could be sanctioned in boilers. After three years' continual use, the boiler, which had but six *millimètres* thickness in the material, for one *mètre* of diameter, was in a perfect state; the surface exposed to the action of the fire had undergone no alteration: the surfaces were clean; the edges at the joints were very bright, and the plates and rivets intact. In consequence of the experience obtained through experiments of this character, the French Government, according to the reporter, are about introducing modifications in their requirements for the materials used in steam-boilers: similar modifications are therefore suggested to the Belgian Government. The reporter gives the dimensions of the parts of the locomotives exhibited,—information which must be of value and interest in Belgium.

Class VI., "Carriages and Equipages for Ordinary Roads," is reported on by M. J. Du Pré.

The report for Class VII., "Machines and Industrial Tools," by M. J. Kindt, testifies to the continued superiority of this country; saying

* "Exposition Universelle de Londres en 1862: Documents et Rapports. Tome I. Bruxelles. Imprimerie de Bols-Wittouck. 1863." Large 8vo., pp. 624. 11 plates.
† See p. 525, *ante*.

that although the manufacture of good machinery is not confined to it, yet that England by the extent of its industry, the division of labour, and the eminently practical and investigating spirit of its manufacturing engineers, by its preponderant resources, and in fine by the constitution even of its industry which rests entirely upon association, perfects its engines of work, or improves them, more surely and quickly than the Continent. If other proofs than these are wanted, M. Kindt says they are to be found in the fact that the machines of the Platts, the Fairbairns, and others, are sent into Belgium, France, Switzerland, Germany, in short to the most advanced countries. Generally, in the machinery in the Exhibition, he does not find anything particularly new, discovered, but says that details have been perfected. What blindness it would be, he says, to close a country against the importation of such useful machines. The Belgian, French, or German engineer, (the last especially) he considers, is generally better informed than the Englishman, and, he continues, "would it be believed that more than one English engineer attributes to that incontestable inferiority, in regard of science, the more sure and rapid progress of English industry." M. Kindt says there is in that, some truth which it is well to meditate upon. The carpet-weaving machinery is described by the same reporter.

Class VIII., "Machines in general," reported upon by M. J. Du Fré, contained scarcely anything in the Belgian Division. In reviewing the class generally, the reporter finds the distinctive character of progress in the equalization generally of machine-making, rather than in the result of any great discovery. In 1851, English iron castings were in many respects inferior to those of Belgium and Paris; but in 1862, great perfection was found to have been attained. The remainder of the report on this class, is devoted to steam-engines and boilers, traction-engines, weighing-machines, pumps, and cranes.

Class IX., "Agriculture," is reported on by M. L. de Mathelin; but there an Appendix by M. J. S. Stas, on apparatus for breweries and distilleries. In the course of the first division, the reporter says, that which is truly remarkable with the English, is a perfection of workmanship beyond all expression.

This report ends the volume. It is not stated how many volumes the reports on the following classes will make.

THE WORKS IN PARIS.

THE QUESTION OF FINANCE, HEALTH, AND RESIDENCE, CONTINUED.

WHILST our article which gave some of the figures of the *Mémoire* presented by the Prefect of the Seine to the Municipal Council of Paris, was at press,* the report was followed, as it is every year with an interval of one or two days, by one to the General Council of the Department. This latter *Mémoire* supplies information that will be considered important, as further corroborative of some of the remarks with which we accompanied the matter quoted from the first report. The information relates to the ever-agitated question of the number of requisite places of residence as affected by the demolitions and new works.

From the 1st of October, 1862, to the 30th of September, 1863, the number of "new constructions" in Paris was 2,943, and that of "houses demolished" 993,—that is following the abridgement, of the *Mémoire*, which appears in the *Presse*. "The gain," according to the same medium of information, "is then 1,956 constructions." There must be an error in one of the unit places of figures; but probably there is none of greater moment. Continuing from the *Presse*,—the *Moniteur* not being just now at hand,—of the 993 demolitions, 337 were carried into effect through bringing to bear the process of the law of expropriation, and 656 were by the free will of the proprietors. The number of places of residence, "*logements*," or *appartements*, created by the new constructions, was 16,496. That of the *logements* destroyed by the demolitions, was 6,189; so that according to the same medium (for, French newspaper compositors' work, even in the *Moniteur*, is execrable; and there is here again, error in a unit,) there is a gain of 10,301 *logements*, or what is supposed to be corresponding to about 31,000 persons. The augmentation since, and including, the year 1860, or from the time when the nominal and fiscal limits of Paris were extended to the fortifications, has been 46,318 *logements*; or, at three inhabitants for each place of residence, there would be room for 138,954 more individuals than previously to the application of the law of the 16th of June, 1859, by which the barriers were extended. It would be more easy to understand these figures, if the previous number of houses in the old *banlieue*, the former suburban zone, were given.

The number of residences has been raised during the last twelve months, from the number 603,444, which it was in 1862, to 613,745; and an addition of the number 1,595, has been made to the apartments vacant.

The excess of new constructions over the demolitions, in the ten last years, has been the number 48,777.

* See page 874.

PROXIMATE CAUSES OF DISEASE.

THE death-rate in Islington, independently of the deaths which occur in the Fever Hospital, is far from being satisfactory: the fatal cases of scarlet fever are still numerous.

We have made another examination of the houses lying to the west of the Caledonian-road towards the York-road, and may first notice a large school connected with a chapel in this district. The school forms the basement of the chapel, and is for the chief part below the surface of the street. There is an area, however, which goes partly round the building. To this school the boys and girls from Bemerton-street and the places around, where there has been much sickness, come. For educational purposes this establishment has a good reputation; and, in the main school, the charge per week is 6d., whereas in the national schools it is only 3d.

There is no task more unpleasant to us than to say anything in disparagement of institutions founded for a good purpose and with the best intentions; but, while education is needful, so is the care of life and health; and the condition of the infant school here, we must say, is dangerous to both. As regards the chief school being so far below the surface, it requires more than usual care as to ventilation: in this respect every attention should be shown: improvements might be made in it; but respecting this we will not particularly remark. The infant school, however, requires immediate alteration: this is a portion of the main school which has been boxed off by partitions. The chief part is occupied by a gallery of considerable height, on which, row above row, the children are packed close together, like oranges in a chest. There are two windows looking towards the area on the west side, and a doorway in the middle of the south partition. With these exceptions, there is no ventilation worth naming; and yet, in this small box, we are told that upwards of eighty children frequently assemble. Very pale were most of the faces that we saw here,—a circumstance not to be wondered at; and it seems surprising that the young lady who has charge of this department should have any energy at all for teaching. In this place both fever and small-pox are either generated or encouraged. It must be admitted that the ventilation of a building situate as this is, may be a matter of some difficulty; for it is necessary, we suppose, that the noise of the infants should be prevented from interfering with the other school. But even if openings could be made into the larger space—where the air is not very good—they would not have a beneficial effect: there might, however, be air shafts made which could communicate with the outer air, and other means used which persons skilful in this kind of work would readily suggest. When the best had been done, however, it would not be right to allow so many children to assemble in such a limited space.

In a dwelling near, in one room, we found a child dead from scarlet fever; another ill of the same complaint; no washing had been done for a fortnight, and the clothes which had been worn by the sick child, and those which had been taken off the dead one, were stowed in the bottom of a cupboard, where the food of the family was kept: there were dirty slops in the room and on the staircase; and the door and window were but too carefully closed: in fact, we were told that the window had never been opened since the sickness began. The woman who lived here had buried three children, and the one lying dead was the fourth lost, while the only one surviving was not likely to live. The other rooms of the house were crowded: the drainage was not good; and two other children had died in the same place not long before. Other places, in which there were sick people, were similarly managed, with bad results. In one place, we found a woman better informed: four of her children, however, had been ill of scarlet fever of a very bad kind; but she fortunately had the means of thorough ventilation through her two rooms: the windows were kept partly open night and day; and the door was also kept a little unclosed whenever it was convenient: the staircase window was managed in the same way; and although she had barely a change, the bed-sheets and children's clothes were washed constantly. In this instance we may be sure that no slops were allowed to remain; and as a reward for this care all the four children recovered. In another room in the same house two children had died of this fatal complaint.

In this neighbourhood there are a number of women from the rural districts, who have been in the habit of occupying cottage dwellings; and for the most part their want of knowledge of the rules of health and their general mismanagement are remarkable.

THE BUILDERS,

TEMPORAL AND SPIRITUAL.

HERE are bricks and there is mortar for ye, build—
Build houses, castles, sanctuaries,
And idols for your joy
There's colour, and there is gold for ye to gild
Your palaces, your statuary,
And Time will all destroy.

There is toil, and there is sorrow for ye, build—
Build care, fear, and anxiety,
Till Death takes ye away.
There are foes in hate and jealousy so skill'd,
Can tarnish fame and gatherings,
And you'll have nought to say.

Here is truth, and there is wisdom for ye, build—
Build kindness, virtue, charity,
And for such works you may
Depend that there is much space which may be fill'd
With greater, stronger monuments
Than Time can wash away.

There is love, and there is mercy for ye, build—
Build holiness and righteousness
Till one continual day.
There have peace and everlasting life been will'd,
Eternal glory, happiness,
To those who build this way.

LOUIS DE VILLE, Architect.

ANNUAL MEETING, INSTITUTION OF CIVIL ENGINEERS.

THE annual meeting was held on the 15th inst., Mr. J. Hawkshaw, President, in the chair. The report of the council stated that the total number of members of all classes on the books on the 30th of November last was 1,040. This was an increase of nearly 39 per cent. in the last ten years, of which 4 per cent occurred in the past session. During the last ten years the number of members had increased to a greater extent than the associates; for, whereas the numbers of those classes on the 30th of November, 1853, were 259 and 441 respectively, or in the proportion of 1 to 1·7, on the 30th of November last these numbers were 425 and 588, or as 1 to 1·4.

It was observed, with deep regret, that while the Institution had lost many useful and able members, there was included in the list one whose memory must ever be regarded with the liveliest interest; for to Mr. Joshua Field, to whom allusion was made, was due, in no small degree, the existence of the Institution of Civil Engineers. It was about the year 1816 that Mr. Henry Robinson Palmer, who was then articled to Mr. Bryan Donkin, first suggested to Mr. Field the idea of forming a society of young engineers, for their mutual improvement in mechanical and engineering science; and it was no doubt owing to Mr. Field's influence that Mr. William Nicholson Maudslay became the third who associated in this cause. These were shortly joined by five others—Mr. James Jones, Mr. Charles Collinge, Mr. James Ashwell, Mr. Thomas Maudslay, and Mr. John T. Lethbridge;—and when the Institution was constituted on the 2nd of January, 1818, it comprised just these eight members, and so remained until the following year, when the number was increased by three.

The abstract of receipts and expenditure, as prepared by the auditors, showed that the income from all sources, during the twelve months from the 1st December, 1862, to the 30th November, 1863, was 3,974*l.* 17s. 1d., while the payments in the same period only amounted to 2,740*l.* 8s. 11d., leaving a balance of 1,234*l.* 8s. 2d. The realised

MILAN CATHEDRAL: PINNACLES AND PORTION OF FLYING BUTTRESS.*

property of the Institution now comprised:—1. General Funds, 9,357*l.* 0*s.* 8*d.* 2. Building Fund, 1,322*l.* 2*s.* 11*d.*; and, 3. Trust Fund, 9,970*l.* 12*s.* 7*d.*; making a total of 20,649*l.* 16*s.* 2*d.*, as against 19,041*l.* 12*s.* 1*d.*, at the same period last year.

The following gentlemen were elected to fill the several offices on the council for the ensuing year:—John R. McClean, president; J. Fowler, C. H. Gregory, T. Hawksley, and J. S. Russell, vice-presidents; Sir William Armstrong, W. H. Barlow, N. Beardmore, J. Cubitt, T. E. Harrison, G. W. Hemans, J. Murray, G. R. Stephenson, C. Vignoles, and J. Whitworth, members; and Colonel Jervois, C.B., R.E., and Mr. C. Waring, associates.

NEW HOTEL FOR KESWICK.

In the very widely spreading hotel-movement, Keswick, in Cumberland, the capital of the Lakes, and one of the prettiest of places, is determined not to be left behind. Designs have been made by Mr. John Ross, of Darlington; and, under his superintendence, the building, of which we give illustrations in our present number, is intended to be erected forthwith. The following references to the plan will sufficiently explain the intentions of the architect:—

* See p. 905, *ante*.

PROPOSED HOTEL, KESWICK.—MR. JOHN ROSS, ARCHITECT.

Plan of Ground Floor.

BOMBAY.

THE Municipal Commissioners for Bombay have, with the sanction of the Indian Government, recently carried a "resolution" to "sewer and drain Bombay," at an estimated cost of "three hundred and thirty-five thousand pounds (335,000*l.*)."

The "*proposition*" for the "main drainage of the native town and fort of Bombay" has been devised and matured by Mr. H. G. Wilcox, surveyor to the Municipal Commissioners; Mr. W. Tracey, assistant surveyor; and is dated 1st December, 1860.

The population provided for is one million residents.

The scheme will be partly gravitating and partly by pumping. There have been several schemes proposed for the sewerage of Bombay, by Dr. Buist and Mr. Perkes, Mr. Conybeare, Colonel Crawford, Captain Trevor, and Mr. Wilcox; Mr. Aber, Mr. Fairbairn, Mr. Forjett, Mr. Walter Scott, and others: Mr. Berkley, C.E., was also consulted.

Early in this year (1863) the whole of the reports, plans, papers, and estimates were submitted by the Indian Government to Mr. Robert Rawlinson, C.E.; and in April of this year, Mr. Rawlinson sent in his report, recommending that the plans and estimates of Messrs. H. G. Wilcox and W. Tracey (with certain modifications, as set forth in his report) be approved. In September, by resolution of the Local Government of Bombay, the plans so approved were "ordered to be carried out,"—"Mr. W. Tracey to be executive engineer; Captain Trevor to be consulting engineer."

We may give details of the plan at some future time.

CONDITION OF LABOUR IN MELBOURNE, VICTORIA.

DURING the Parliamentary recess in this colony, the *Argus* has been employing some of its staff in collecting information, as to the state of the labour market, which is of great value; and some particulars are of such interest that we collect a few from the various articles, which have extended over a period of three or four weeks. The masons are the first noticed, and stated to number nearly 900 in and around the metropolis, with an average wage of 8s. to 10s. per diem of eight hours. The masons as a body are reported to be in a more depressed state than other trades, which is mainly attributed to their tyrannical conduct in former times, when piece-work was not allowed, and a uniform rate of wages insisted on for good and inferior workmen. Now the societies having broken up, piece-work is taken, and men make what wages they can, although very few work overtime for more than a day or two together. The rates said to rule in 1850, when the country was strictly pastoral, and men working ten hours a day, was 6s. and 7s. In 1854, just when the great gold fever excitement was subsiding, the rate was 28s.: it had been 38s. and 42s.: now, as stated above, it averages 8s. to 10s. Tables are given, showing that even at the reduced rate the mason is in an improved position, inasmuch as, while his balance after paying weekly expenditure is less, money will go further than formerly. Prices are very fairly quoted of all the leading necessaries for a workman and his family; and as a general synopsis the following is shown to be the balance that a steady working man, with a family, would be able to put by each week at the three several periods referred to:—

	1850. £. s. d.	1854. £. s. d.	1863. £. s. d.
Wages	1 19 0	7 10 0	2 14 0
Expenditure	1 16 6	6 7 8	1 18 7
Surplus	0 2 6	1 2 4	0 15 5

The next article and a later one treated of the workers in metals, of whom it is said, that there are some 700 to 800 in and about Melbourne, 390 of whom are engaged in the three largest foundries. These mechanics are still receiving good wages, although not so high as formerly. By way of comparison, it is stated, that the same workmen who would think they had made a good wage, at Mare's, when they had earned 3*l.* per week, have, even very lately, at Langland's, earned as much as 10*l.* 4s., and that 8*l.* 11s. is no unusual week's wage for such men. The average week's wage appears to be 4*l.* 4s.; the day's work being also eight hours. The raw material likewise operates to keep up prices; for the market is dependent on foreign supplies for pig iron, which costs some 4*l.* per ton. So that, for instance, cast-iron water pipes, which can be imported and delivered at Ballarat at 8*l.* 10s., would cost, if made here, 12*l.* to 18*l.*, according to size. As to ability displayed by the mechanics, the colonial tradesmen are quite equal to those in any part of England.

The carpenters next came under review; and of them it is stated, that there are some 1,600 who are generally well employed, at wages ranging from 8s. to 10s. per day, although in some cases men are content to take piecework at prices which will not give them more than 5s. or 6s. The conduct of workmen in this branch of the building trades operates seriously against their real advantage; for, whilst so many go about as petty contractors, competing with their former employers, there is no encouragement to masters to establish workshops and yards, the want of which is the great drawback experienced by both master-builders and architects. The joiners' work for each job is for the most part prepared on the spot, and the builders keep no stock of timber by them. The same hands prepare and fix the work. As a body, however, to their credit be it said, they are sober and steady, and there are very few who reverence Saint Monday.

The last noticed are the bricklayers and plasterers. Of the former it is estimated that there are some 350, who are pretty well employed at 10s. per day, a few working at 9s. Piece-work, however, is very often adopted, either at per rod or 1,000 bricks, at prices varying according to quality of work.

The plasterers are about 300 in number, and their wages are about the same as the bricklayers' where they work day-work; but piece-work is very customary, rates varying from 8d. to 1s. per yard. The same remarks made with reference to carpenters competing with their masters applies to plasterers. So much for workmen: now for works.

The late Governor, Sir Henry Barkly, became quite an adept at laying foundation stones. About his last public non-official acts were the laying of foundation stones for a Wesleyan Church on Emerald-hill, one of the suburbs, which is now nearly completed, the cost of which will be about 2,000*l.*, and will accommodate nearly 500 persons. The architects are Messrs. Crouch & Wilson. The other was the foundation-stone of an Odd-fellows' Hall, in Swanston-street, immediately opposite the Public Library, for which Mr. Terry is the architect. The building contains a large hall and several suites of offices. Mr. Terry also has in hand a new office at Ballarat for the Union Bank of Australia. Mr. Lloyd Taylor is making preparations for the erection of a large church in East Collingwood. The post-office still progresses slowly, while the *employés* are being suffocated in a small wooden box adjoining. Everybody wonders that the Government do not push this work on more vigorously, and release the servants from such miserable confinement, which must materially affect their health.

Tenders have been opened for the extension of the Victorian Railways through Batman's Hill to the wharf. The lowest (accepted) was over 24,000*l.*

THE IRON TRADE OF BELGIUM.

AN account of the iron trade of Belgium appears in the official report by Her Majesty's Secretary of Legation at Brussels, from which we condense a few particulars:—

Iron ore is found in abundance in every province of Belgium, but principally in Namur, Hainaut, Liege, and Luxembourg—the four mining provinces. That found in the five northern provinces is all so-called "alluvial" ore, found on the surface, and not in subterranean mines.

The great bulk of the iron produce is now raised from the so-called "free iron mines," *i.e.*, mines not legally conceded. Only 20 miles are provided with concessions: all the others, nearly 2,000 in number, situate in 109 different communes of the four mining provinces alone, are tolerated to exist without restriction or taxation, under the name of "minières," though most of them are subterraneous. The number of these pits in 1855 was 1,208, and the labourers employed in them were 5,271: the number of communes was 64. As the number of communes having such mines has increased since then to 109, it may be presumed that the number of pits and hands employed has risen in a similar proportion.

Belgium possessed in 1820 about fifty iron blast-furnaces adapted for charcoal, and not one for coke. Since then a great number of the latter have sprung up in the coal-basins of Liege and Charleroy. Numerous refining and cupola furnaces, as well as puddling, rolling, hammering, splitting, and wire mills, have been erected and provided with the best appliances. The wealth created by this metal alone was estimated at 81,000,000 francs in 1860, and the exports at 24,750,000 francs. Belgium does not possess, like Wales, beds of iron and coal overlying each other in the same mine, but possesses both minerals in close proximity to each other.

The number of smelting-furnaces in blast has fallen from sixty-six in 1857 to fifty-one in 1860, only one more than in 1820; but these fifty-one being all, with eight exceptions, adapted for coke, produced 319,913 tons of pig-iron, valued at 26,500,000 francs—probably four times the amount of the earlier period. Still these figures show a great falling off since 1857. Belgian irons compete closely with our own in quality and price. In the former respect they are superior to our ordinary descriptions, which is attributed to the universal employment of coke in Belgian furnaces instead of coal, as is usual in England. Some articles of wrought-iron, such as wheel-tires without joints, and fish-joint bolts, can be made in Belgium more cheaply than in England. In rails the Belgians compete successfully with the Welsh, owing to differences of quality in foreign markets. The nail manufacture is a Belgian staple which has attained immense proportions: it offers the great advantage of being exercised in the workman's own house, at his own fireside, and even in his own kitchen fire: it is the winter employment of thousands, who in spring migrate to France to make bricks. Belgian nails are exported to all parts of the world.

The iron exports of all kinds have risen from 11,750,000 francs in 1851 to 25,000,000 francs in 1857 and 1860. The export of pig-iron has receded since 1857, owing to the increase of duty in the Zollverein; but that of ores and wrought-iron has been and is constantly progressing. The year 1861, however, has been one of depression.

The Belgian ironmasters have shown themselves advocates of progress and free trade: they have declared themselves ready to meet English competition, though at present in possession of a virtual monopoly of the home trade.

FRENCH BRONZE CASTINGS.

A CORRESPONDENT of the *Morning Post* gives an account of the great workshops of the famous firm of Barbedienne, the first bronze manufacturer in France, which by the energy of its director has in about eleven years grown from an establishment in which there were only an *ouvrier* with a man and an apprentice, to one in which there are employed 350 workpeople, many of whom are artistic workmen of considerable skill. In one part a man was busy with a small piece of metal, the ornamentation of which required mathematical precision in the flow of its lines. It was to be a most complicated piece of enamel work. At his side, in a little bay, was some of the rich dark Fontenay sand; and ever and anon, as he made some infinitesimal addition to his work, he tested its accuracy by taking an impression of it with a pinch of the sand. Before another workman lay a section of a mould for a cast of the Three Graces, a most complicated piece of workmanship, with a number of tortuous channels pierced in various parts of it, through which the metal was to be poured, for the cast must be sundered where the lines and angles were complicated, in order to make the metal reach every little crevice. Elsewhere a man was mixing in just proportions the new yellow Fontenay sand with the black. The black being that which had already served, he said,—"We mix the new sand with the old. The sand is too precious to be used only once, and we find, indeed, that the mixture of the old with the new is a good combination. This sand is to be found only at Fontenay-aux-Roses. To it we attribute much of the excellence of our French castings: other sands have too much silex in them, and this has exactly the proportion necessary for our work."

In the course of his progress through the various departments of this establishment, his conductor told the writer, — "As you are an Englishman, you ought to know something about this great work we have in hand. This capital is part of the tomb of the late Prince Consort, at Frogmore. We have at present many men there at work upon it. It will be a most costly affair. The designs for all this work in bronze have been made by our artist in our own *atelier*, on the Boulevards. It is a description of work that could not be performed with this finish and elegance in England. There is a peculiar excellence about French bronze castings which has never been reached by any other nation." [This we do not admit.]

The process of enamelling is extensively carried on here. That for which Barbedienne's house is celebrated is a most wearying process, demanding both great skill and patience. In one room were women cleaning the edges of the enamels after their first subjection to the fire. In another seated at a table, in shape like a lady's silk-winder, with rows of pots filled with bright rich colours ranged round them, they were filling in the patterns carved in the metal. In the third room was a great furnace, before which a man as well dressed as a banker's clerk was standing, holding a flat shovel with a very long handle. With this he was very daintily depositing jars with enamels in them in the white heat of the furnace. This is the perilous part of the enamelling process. By a slip of the hand he may destroy the work of many days. In the chasing shop was one workman, who had a small vase before him, which he was preparing for the enameller. He had already spent forty days on it.

We are famous in England in the production of large castings in all kinds of metals, and we should like to see more attention paid to those of a smaller and more refined description; for, while advocating the principles of free trade in both commerce and art, it is somewhat unpleasant to think that the tomb of our lamented Prince Consort should, in consequence of our want of refined skill, have been sent for execution abroad. It could be done in England, but the cost would be much greater.

NOTE ON A CHINESE TEA CHEST.

We have just now before us one of those small square wooden tea-cases, in which are packed, for sale in the English and other markets, the finest kinds of the valued Chinese plant. This little tea-case is worth some remark on account of the peculiarities of its decoration.

The box is about a foot square, and each side is differently ornamented. The surface is varnished in a dead flat manner—a plan which might be usefully adopted in connexion with many of the paintings of both ancient and modern masters instead of giving that brightly-polished surface which often catches the light and renders the work invisible except from one position.

At a first glance, it might be thought that the patterns of the tea-chest were cleverly painted on a light buff ground: a more close examination shows, however, the yellower tint on which in green and black there are printed, most likely from wood-cuts, the representations of fruit, trees, birds, butterflies, elephants, &c. In the combination of these forms no account seems to be taken of the comparative sizes, nor are the shapes in accordance with nature. The veins of the leaves are carefully shown on the delicate green in black markings. The general style of this ornamentation is not unlike that of some of the English Mediæval wall-painting and tapestry. Round the edges of each square there is a running scroll pattern, about half an inch in width, of a dull madder scarlet colour, on a ground nearly white. This has been printed in slips, which, when cut of the proper length, have been pasted on the box. In the centre of most of the compartments, badly printed in black, on a deep orange ground—something of the same tint as the cover of the *Cornhill Magazine*,—are the mark of the merchant and other devices: each side is of a different pattern, and the general effect of the arrangement of the colours is rich, and, at the same time, harmonious and delicate.

With certain modifications and an improvement of the forms, which need not necessarily destroy the picturesque character, ornamentation of this kind might be often adapted, with good effect, to the adornment of the walls of rooms and staircases. The green colour seems to be some vegetable preparation, which is more pleasant to the eye and more wholesome than those arsenical tints which have caused so much mischief. The black used for the merchants' marks on the tea-chests is remarkably intense;—deeper, as we think, than that used for the finest English book-printing of the present day. To this and some other points of the ornamentation of these articles, the Western decorators might usefully refer.

Taking note of this simply as a case for a particular description of goods, the care and taste with which it is got up contrast with the way in which these matters are managed at home. Some will say, "What odds about the case if the contents are of a high quality!" This is not wise; for, however excellent an article may be, its worth is enhanced in both the home and foreign markets by a tasteful and well-designed inclosure. There has been of late years considerable improvement in this way, but much more remains to be done.

Many of the cases for preserved fruits, articles of silk mercery, artificial flowers, and gloves, which come from France, Italy, Switzerland, and elsewhere, and are seen in such large numbers, especially about Christmas time, are very pretty, and some have considerable artistic merit.

TELEGRAPHS.

The apparatus employed to transmit intelligence by means of electricity may be divided into two great classes—telegraphs whose signals are transient, and must be read off one by one as they appear; and those which record their signals permanently, so that they can be read at leisure.

The instruments used in this country, of the first class, are the double and the single-needle telegraphs of Cooke and Wheatstone, used by the Electric Company and the South-Eastern Railway Company,—the single needle requiring one wire and the double needle two,—and a modification of the single needle used by the Magnetic Telegraph Company.

Instruments of this class indicate letters by the separate or combined movements of their needles or pointers, are very simple in their construction, little liable to get out of order, and therefore are most suitable for the business of a railway, where skilled clerks cannot be employed.

The telegraph of Professor Wheatstone, in which a hand points to the letter itself on a dial, is gaining ground for private use; and the Bell telegraph of Sir Charles Bright, which reproduces the signals of the Magnetic Company's needle instrument by strokes upon two bells of different pitch, one of which represents the movements of the needle to the left, the other the movements to the right, is extensively used by the Magnetic Company, and has the advantage of leaving the hands free to write down the message as received.

The instruments of the second class are the so-called printing telegraphs of Morse and Bain, which *record* the signals received in an alphabet composed of dots and strokes. These instruments are used on all the important circuits of the Electric Company, and Morse's system is generally employed throughout Europe.

The type-printing instrument of Professor Hughes has been introduced; but it is said not to be very successfully worked at present. It records the message in ordinary letters, which can, of course, be read by any one.

Professor Wheatstone has also introduced a type-printing instrument for private use.

The commercial value of an instrument does not depend upon the use of the ordinary alphabets, but upon the amount of work it will turn out, and its accuracy and freedom from derangement. The Morse instrument is at present unsurpassed in these respects, and it has been found that its introduction upon a circuit previously worked by the needle system reduces error to a very considerable extent. This arises from its signals being *recorded:* they can be read calmly and without flurry; and should an error arise it can be traced to the person in fault, thus inducing a far greater sense of responsibility.

It may be interesting to note the speed attained by the double needle and Morse instruments in a *fair* trial of speed.

The highest speed on a circuit of a little under 200 miles was—

Double needle	35 words per minute.
Printing	38 ,,

Average of between two and three hours' continuous work reporting a speech of Mr. Bright:—

Double needle	24·3 words per minute.
Printing	26·5 ,,

and for a circuit of more than 400 miles:—

Printing, average speed....24·5 words per minute,

clerk reading from the manuscript of the *Times* reporter—not always very legible.

For these particulars we are indebted to a practical work recently published by Messrs. Longman.* The author is a telegraphic superintendent, as well as engineer, and his strictly practical and instructive book has been published with the sanction of the chairman and directors of the Electric and International Telegraph Company, who have adopted it for the use of their staff. It contains information concerning the electrical laws upon which the system depends; the methods of discovering faults; the practical management of apparatus; and the construction of a line. The author supplies to a certain extent that technical knowledge which has hitherto been attainable only by means of verbal instruction or actual experience; so that the work cannot but be useful in the promotion of a practical knowledge of the telegraph. The treatise is popular rather than strictly scientific.

* A Handbook of Practical Telegraphy. By R. S. Culley, Telegraphic Engineer. London: Longman & Co.

RAILWAY STATISTICS.

The traffic receipts of railways in the United Kingdom amounted, for the week ending the 5th of December, on 11,028 miles, to 563,720*l.*, and for the corresponding week of last year, on 10,578 miles, to 517,950*l.*, showing an increase of 450 miles, and of 45,770*l.* in the receipts.——The cost of repairing and renewing the rolling stock of our different railways is 1,243,714*l.* per annum, or about 8¾ per cent. of the total expenditure of the companies. This sum does not, in all cases, include the cost of repairing the locomotives. If we value the entire rolling stock at 27,000,000*l.*, and deduct (say) 10,000,000*l.* as the cost of the locomotive engines, the value of the wooden rolling stock will remain at 17,000,000*l.*; and upon this amount the annual depreciation is (say) 1,250,000*l.* It is not to our credit as machinists that foreigners have paid much more attention to these things than we have. On various parts of the Continent carriages are to be seen far more elegant in form and finish, and of very much less weight, than our heavy passenger vehicles. In America, passenger-carriages, mails, and goods-vans, are now very generally built of plates of corrugated and ridged iron, and such carriages ("metallic cars," as they call them) are said to be stronger, considerably lighter, cleaner, more comfortable at all seasons, more durable, and less affected by noise than wooden vehicles. The cost of iron in this country is so much below that in America, that anything that could be produced at a selling price on that side of the Atlantic might certainly be produced here at even a less rate. Iron-framed passenger-carriages have already been constructed in this country: it might be well if the principle were more largely tried.

CONCRETE.

M. Henry, London, has obtained a patent for, "Apparatus for manufacturing *beton* and artificial stone, pugging clay, &c." This invention mainly refers to the manufacture and application of a certain *beton* composition or artificial stone, for which François Coignet obtained British letters patent, respectively numbered 2,659 and 2,757, and dated 26th November, 1855, and 6th December, 1859. The invention first relates to improved machinery for manufacturing Coignet's patent *beton* or artificial stone, such machinery being also applicable for mixing concrete pugging clay, working mortar, and other similar purposes. Machines hitherto constructed for these objects have been provided with one or two small ejection orifices, through which the materials are forced out or discharged. Now, according to this invention, the machine is formed with an ejection opening extending continuously, or nearly continuously, or without, or nearly without, division or break, round the discharge end of the machine; or large or numerous, or both large and numerous, ejection openings are distributed all round that end of the machine. By these means the materials, after having been mixed, pugged, or treated in the machine, are discharged therefrom freely and continuously, with little or no obstruction or resistance. The chamber or casing of the machine is constructed of three parts, in one of which the ejection openings are below the two others, and one of these latter is removable, so that the chamber may be easily cleansed. In this chamber a shaft revolves, carrying appliances for mixing, kneading, or otherwise acting on the material, and others for pressing, drawing, or heaping them towards the ejection orifices, and for discharging them therefrom.

PREMIUMS FOR ART-WORKMANSHIP.

The judges appointed by the Society of Arts to report on the works sent in competition have made the following awards:—

The Human Figure in Bas-relief.—1st Prize of 10*l.* to J. Griffiths, 51, Coleshill-street, Eaton-square; 2nd Prize of 5*l.* to A. Chesneau, 11, Roxburgh-grove, Haverstock-hill.

Ornament in Bas-relief, Arabesques.—1st Prize

of 5*l.* to C. H. Whitaker, Sheffield-place, Coventry-road, Birmingham; 2nd Prize of 3*l.* to J. Steel, jun., 88, Hanover-street, Glasgow.

Repoussé Work in any Metal.—The Human Figure as a Bas-relief.—2nd Prize of 5*l.* to E. Beresford, 47, Green-street, Stepney.

Ornament, after a Flemish Salver.—1st Prize of 5*l.* to G. Webster, Woodbank, Walkley, near Sheffield.

Hammered Work, in Iron, Brass, or Copper.—Ornament, after an Iron German Arabesque.—Two 2nd Prizes of 3*l.* each to T. Bailey, 77, King Edward-road, Birmingham, and W. Ash, 7, Martlett's-court, Bow-street.

Carving in Ivory.—The Human Figure in Bas-relief.—1st Prize of 10*l.* to J. W. Bentley, 22, Sherwood-street, Golden-square; 2nd Prize of 5*l* to "Ricardo" (name not given).

Chasing on Metal.—The Human Figure, Gibson's "Psyche."—1st prize of 10*l.* to W. Holliday, 14, Naylour-street, Islington; 2nd prize of 5*l.* to C. Jacquard, 1, St. George's-road, New Kent-road.

Ornament, after a Bronze Plaque.—Two 1st prizes of 5*l.* each, to G. R. Meek and R. E. Barrett, at Messrs. Hunt & Roskell's, 26, Harrison-street, Gray's Inn-lane; two 2nd prizes of 3*l.* each, to R. Orpwood and G. Gibaud, at Messrs. Hunt & Roskell's.

Painting on Porcelain.—The Human Figure, after Raffaelle's "Boy bearing Doves."—1st prize of 10*l.* to E. E. Dunn, Eastwood-vale, Hanley, Staffordshire; 2nd prize of 5*l.* to Thomas Allen, Howard-place, Shelton, Staffordshire.

Ornament, after Arabesques.—2nd prize of 3*l.* to J. B. Evans, South-street Mount Pleasant, Fenton, Staffordshire.

Inlays in Wood.—Ornament, after a Majolica Plate.—Two 2nd prizes of 3*l.* each to F. Braun and H. Braun, 15, Cleveland-street, W.

The new list of premiums, amounting to nearly 500*l.*, is almost completed. Ample time will be given on this occasion to competitors.

DRAWINGS OF JERUSALEM AND THE HOLY PLACES.

M. CARL WERNER, whose ability as an artist is well known, is exhibiting at the Water Colour Institute, Pall-mall West, a series of thirty drawings made in "Jerusalem, Bethlehem, and the Holy Places," including the House of Pilate, never painted before; various views in the Church of the Holy Sepulchre and the interior of the Mosque of Omar; the Grotto del Latte, Bethlehem; the Jews' Wailing Place, and a general view of Jerusalem. These are to be reproduced in chromo-lithography by Messrs. M. & N. Hanhart, and published in parts with descriptive letter-press. The interiors have the aspect of careful representations, and some of them seem to lack air and are a little over-hard in consequence. The series is a very interesting one, and if reproduced effectively, as we have no doubt, being in the hands of Messrs. Hanhart, it will be, can scarcely fail to command a good sale. The work will be published by Messrs. Moore, McQueen, & Co.

CHURCH-BUILDING NEWS.

Hampton-hill.—St. James's Church, Hampton-hill, has been consecrated by the Bishop of London. The church consists at present of nave, chancel, and vestry, and it is intended to enlarge the edifice by the addition of double north and south transepts, organ chamber, tower, and lofty spire. The nave is 67 feet by 24 feet, and the chancel 24 feet by 20 feet. The style is Early English. The whole of the walls are of brick, blue and red being used for the arches, jambs, bands, &c., both externally and internally; while the chancel arch is also of brick, arranged in ornamental devices. The roof is open timbered. The sittings are of deal, all open. The whole of the woodwork is simply varnished. The flooring to the pews and stalls is of wood, and the chancel and gangways are laid with blue and red tiles, arranged, according to the design of the architect, in panels, with crosses, &c. The sittings are for 305, and the total contract was for 954*l.* Mr. Wigginton was the architect. The contractors were Messrs. Bond, of Hackney.

Deptford.—The foundation-stone of a new church has been laid here. The site is in Church-street. The building will accommodate 1,200 persons, and all the seats will be free. The design has been supplied by Messrs. Newman & Billing, who have rendered their services gratuitously; and the contractor for the work is Mr. Peake, of Tooley-street. The total cost of the land and building will be 5,000*l.*

Eling (near Southampton).—The old parish church of Eling, after being for some months closed for alterations and additions, was re-opened on the 8th instant by the Bishop of Winchester. The little lean-to aisle and gallery have been superseded by a new south aisle, capable of seating 200 persons, the galleries having been taken down, and the Early English nave arcade restored. The noble chancel arch, supposed from its great size to have been intended for a larger church, has been stripped of the whitewash with which it was bedaubed. There is a very early Norman arch separating the north aisle from the chancel aisle, and this has also been restored. The roof is open, the ribs being stained. The chancel ceiling is polygonal, the panels being separated by ribs with carved bosses. The new pulpit and chancel fittings are made from old oak, obtained in the church, and the carved enrichments include various emblematical figures. The present sittings, which amount to nearly 600, are benches of stained deal. The altar-cloth was worked by the vicar's family. The heads of the two wheel-headed windows in the south aisle have been filled with stained glass. The whole of the works have been executed by Mr. Till, builder, of Romsey, from designs by Mr. Ferrey, of London, at a cost of somewhat upwards of 2,000*l.*

Reading.—The new Greyfriars Church has been consecrated. The building as it stood when purchased by the Archdeacon of Carlisle consisted of the nave and north and south aisles. As soon as Mr. Phelps had purchased the ruins, his architect, Mr. Woodman, commenced excavating round the church, and fortunately traced the foundations at a considerable depth. From the slight indications he found, he has been able to restore the edifice to its original form, with the exception of the chancel, which it has been found difficult to re-build, as the land upon which it would stand could not be purchased of the present owner upon such terms as the archdeacon considered equitable. In a letter from Dr. London to Lord Cromwell, he says, "I have inwardly defaced the Churche and Dorts." This was so effectually done that not a single relic has been discovered, and only about a square yard of the tesselated pavement, which has been re-laid in the restored building. The tiles have the unusual devices of hares, stags, and dogs in the attitude of running. Traces of stained glass were found in each of the windows. An entire skeleton was found under the north jamb of an arch: the body was evidently laid in the foundations when the church was commenced, and the walls built over it. The seats are of oak; the desk, screens to the doors, and the altar-railing of oak, carved with foliage; the pulpit and font of Caen stone. The church is warmed with hot air, by Haden, of Trowbridge. The acoustic properties of the building are said to be satisfactory. There will be accommodation for 750 to 800 persons. Messrs. Wheeler were the contractors for the stonework. Mr. Sheppard contracted for the remaining part of the works.

Fontmel (Dorset).—The parish church has been rebuilt and consecrated. The style, like that of the old edifice, is Late Perpendicular. The church consists of a nave, with north and south aisles, chancel, tower, and south porch, besides a robing-room at the north-east angle of the nave, opening by an arch screened off into the chancel. The walls are built with the native stone from Melbury, and the whole building is surrounded with a parapet of tracery work, ornamented with crocketed pinnacles supported by carved gurgoyles. The tower has a new story, embattled. The roof is covered with milled lead. Interiorly, the walls are cased in stone. The aisles are separated from the nave by four bays, the old clustered piers having been restored, and capitals of Bath stone added, the designs of each being alternately floriated, or representing angels. From these spring moulded arches, which give lightness to the interior. An arch separates the chancel from the nave, and the tower arch is also open, without any gallery. The whole of the roofs rest on carved bosses of Bath stone, those in the aisle having floriated designs, alternating in the more prominent with angels bearing scrolls, shields, and different symbols, while in the chancel they represent angels in the act of adoration. Those in the aisles and porch are the heads of saints, &c. The roofs of the nave and chancel are open, and framed in panels of pitch pine, with moulded ribs. All the roofs are boarded diagonally with planks to carry the lead. The floors are laid with Minton's tiles, the chancel being raised by a Purbeck marble step, and the sacrarium by another, while within the altar rails the tiles are of a varied tesselated character. Here on the north wall are written, in illuminated characters, the Ten Commandments, by Miss Salkeld, who, according to our authority, the *Dorset Chronicle*, "was to be led to the altar on the following day as the first bride to issue from the sacred portal." It is intended to fill the five-light east window with stained glass, as well as the whole in the chancel; and there will be ample light afforded by the others, the four in the north aisle preserving the Early Perpendicular character of some in the old building, while those in the south aisle are Late Perpendicular. The churchyard, which contains the monument to young Lieut. Salkeld, the hero of the Delhi gate, has been enlarged and enclosed with a wall, with new entrance gate, &c. The edifice has been rebuilt at the cost of Sir R. P. Glyn, Bart. The architect was Mr. Evans. The stone work was executed by Mr. Knott, of Wimborne; the wood work and wood carving by Mr. Mondey, of Dorchester; and the stone carving by Mr. Boulton, of Worcester. Mr. Blethman, the builder's foreman, constructed the pulpit.

Dorchester.—The re-opening of the ancient Abbey Church at Dorchester took place on the 3rd inst. In 1860, the present Incumbent, the Rev. W. C. Macfarlane, anxious to bring to completion the work commenced by his predecessors, initiated further restorations, and about 1,000*l.* have been expended annually during the last three years, the rev. gentleman being himself a liberal contributor. The external walls have been repaired and the drainage attended to: the porch and doors have been renovated or rebuilt; while on entering the building the marks of restoration are visible on every hand. The remainder of the edifice, with the exception of the south chancel aisle, has been new roofed with pitched pine; the wheel-plates and mouldings being of oak. The south aisle has been restored. Encaustic tiles have been laid down in the sacrarium, by Mr. Godwin, of Hereford, the pattern being taken from some remains extant in the church; and the wall painting discovered some years ago, and believed to be one of the earliest known, has been renovated by Messrs. Clayton & Bell, of London. Red, in different shades, is the only colour employed. This aisle, as well as the nave, has been repaved. Mr. Scott has been the architect retained, and the contractor was Mr. Winterborne, of Abingdon.

Worcester.—The foundation stone of Holy Trinity Church has been laid at Shrub Hill. The site is a sloping bank on the road to the railway station. The style will be Late Decorated—the same as that prevalent when the old Guesten Hall was erected. The whole length of the church from east to west will be 146 feet, and the total width across the transepts 76 feet, height to the apex of the roofs 56 feet. The architect is Mr. W. J. Hopkins, under whose supervision the works will be carried out. The roof of the old Guesten Hall is to be used in covering the new edifice. Although some portions of the timbers were much decayed, and the tenons for the most part rotten or cut off, yet by the introduction of ironwork the roof, it is said, is rendered perfectly strong. The committee have determined to restore it with oak. The principals are 28 feet by 13 inches and 8 inches, and the other timbers of proportionate size. All the rafters must be new.

Aston Brook.—The Church of St. Mary, Aston Brook, was to be consecrated on the 10th inst. The church is erected on the estate of the late Mr. Josiah Robins, by his family, as a memorial of that gentleman, and the late Mrs. Robins, of Allesley. The plan consists of nave, chancel, and aisle, with chancel aisle to the north, and vestry on the south side. The chancel is terminated by an apse with three-light traceried windows, and has open stalls with carved poppy-heads. The nave piers are of stone, and have carved capitals supporting the nave arches, and a clerestory. The roofs are all of open timber work, and the church is fitted throughout with open benches of deal stained and varnished. At the north-west aisle will rise a tower crowned by a spire, of which only the first stage will now be erected. At the west end is a traceried window. The style of the building is Gothic of the latter part of the thirteenth century, adapted to the material with which the structure is built, namely, red bricks, with bands and dressings of Bath stone. The building has been erected from the designs of the late Mr. James Murray, of Coventry. Mr. Mault, of Coventry, was the contractor.

Manchester (Withington).—St. Paul's Church, Withington, near Manchester, has been lengthened, and a chancel, chancel aisle, organ chamber, and vestry have been added. The plaster ceiling has been removed, disclosing the timbers of the roof, which have been stained and varnished. The chancel is fitted up with carved oak stalls, the front being

movable in order to show the encaustic tiling, by Messrs. Minton & Co., and the gas standards, lectern, and communion railing are of polished brass-work, by Mr. Skidmore. The pulpit and font are of Caen stone and marble, panelled and carved by Bouchill, of Manchester, from the architect's design. There are two sunlights to the nave, and brackets under the gallery and in the tower, and the heating is by means of Haden's apparatus. The stained glass in the chancel window is by Messrs. Ward & Hughes, of London, and represents remarkable events in the history of St. Paul, and also the Birth, Death, and Ascension of the Saviour. By the alterations an increased accommodation for nearly 250 persons has been obtained; and the works have been carried out by Mr. Terras, builder, Manchester, under the superintendence of the architect, Mr. John Lowe, of the same city.

Stonegrave (near Hovingham).—The new church of Stonegrave has been re-opened by the Archbishop of York. The building is nearly all new, and comprises a chancel, nave, with clerestory, north and south aisles, and nave with arcades. The tower remains. The various stained-glass windows are all the workmanship of Messrs. Ward & Hughes, of London. Mr. F. Jones, of York, was the architect.

Fiskerton (Lincolnshire).—The Church of St. Clements, in this village, has been restored, under the supervision of Mr. Christian, architect, by Mr. W. Huddleston, of Lincoln, builder; at a cost of 1,100*l.*; and re-opened for divine service.

Alnwick.—The organ recently erected in St. Michael's Church, Alnwick, was built by Messrs. Forster & Andrews, of Hull, and not by Messrs. Forster & Forster, of London.

EMBANKMENT OF THE NORTHERN SHORE OF THE THAMES.

AT the last meeting of the Metropolitan Board of Works, the tenders, fourteen in number, for the construction of the Thames Embankment from Waterloo Bridge to the eastern end of the Temple Gardens, were received and opened by the chairman. The following were the tenders:—

Pearson	£264,000 0 0
Tatam	264,000 0 0
Dowra	260,000 0 0
Eckersley & Baylis	257,001 0 0
Moxon & Co.	243,195 0 0
Furness	241,500 0 0
M'Cormick & Son	240,656 0 0
Webster	240,000 0 0
Lavers	239,800 0 0
Brassey & Co.	238,500 0 0
Rogers, Booth, & Co.	238,500 0 0
Dethick	232,353 0 0
Diggle (Dover)	229,400 0 0
Ritson & Co.	229,000 0 0

The tender of Messrs. Ritson & Co. was accepted, subject to the usual inquiries as to sureties.

A BIT ABOUT THEATRES.

WHILE I confess to being a Classicist, so far am I from being a blind and bigoted one that I frankly admit a disagreeably large proportion of modern *soi-disant* examples of so-called Classicism to be far from satisfactory—rather calculated to discredit the style, if not actually put one out of conceit with it. In like manner, though well affected towards Palladianism,—taking that term in the greatly enlarged meaning given to it by Wightwick, I have no particular admiration for Palladio's own doings; and, as the *Builder* has just shown, one of his most celebrated works, viz., the *Teatro Olimpico*, at Vicenza, some remarks may not be altogether unacceptable. The idea of copying, as far as was at all practicable, a veritable ancient theatre, was surely akin to that which prompted the pedantic doctor in "Peregrine Pickle" to inflict upon his guests an ultra-classical dinner, with its far more stomach- than appetite-exciting dormouse-pies. This celebrated theatre,—held to be Palladio's *capo d'opera*,—is no doubt an architectural curiosity, and is so far instructive as it shows very forcibly how a theatre ought not to be arranged. What says one of the Adams of it—whether it was Robert or James seems to be doubtful—in his "Journal of a Tour in Italy," published in the second volume of "The Library of Fine Arts?" "The seats are not convenient for the spectators: the order over them is most pitiful. In the angles of the circular (curved) part the spectators cannot see the performers, and the seats begin much too high above the stage. The *scena* is the most crowded and ill-adjusted thing I ever saw; and the alleys in perspective are perfectly childish." Nor is that condemnation at all too strong. A blank wall would be quite as much to the purpose as a permanent *scena* of that kind; nay, even more so, because in such case these jar violently with verisimilitude, &c. The absence of background would be less intolerable than the constant presence of an utterly unmeaning one, and that for every performance alike. But for the gratuitous absurdity of the *scena* the actors might have shown themselves as do the figures on a monochrome Greek fictile vase, where, though there is nothing to aid, there is also nothing to disturb, or even run quite counter to even decently-sustained probability. It may, perhaps, be all very well for bishops *in futuro* to signalise themselves by editing Greek dramatists; yet—I am speaking now quite profanely,—whatever their poetical merits, the dramatic performances of the ancients must have been rather bungling affairs; and so also their theatres, as far as the stage itself is concerned. As Miss Seward has well observed in one of her letters, could Aristotle have been acquainted with Shakspeare, we should have heard nothing of the Unities, the observance of which occasions far more incongruities and sins against *vraisemblance* than it professes to obviate; for what can be more contrary to probability than that the whole intrigue of a plot should be settled and concluded within no longer time than that of the actual representation? Expeditious work that, and very different from getting into Chancery! To come back from this wandering:—For a striking exemplification of decided progress, Fergusson might refer to theatre-building as well as to ship-building. Scenery and stage mechanism have, in fact, been brought to the limits of conceivable perfection;* one unlucky consequence of which is, that, while spectacle has advanced, the drama itself has declined, and has, to all appearance at least, come to be regarded as quite secondary to scenic display. The extent of stage as to width is itself an inconvenience, and renders it far more difficult to represent an ordinary-sized room than a palatial hall, unless some mode could be devised of contracting and enlarging the opening of the stage, both as to height and width, accordingly as circumstances might require. There is, moreover, still room for improvement in another respect. Notwithstanding the supremacy of spectacle, the spectatory of our theatres is so contrived that at least one-third of those present cannot be spectators at all, unless gifted with most extraordinary obliquity of vision. With this remark I conclude, at least for the present.

AN ART LOVER.

NUMBERS FOR NIGHT.

YOU will do a good deed this Christmas by inducing builders (and others so employed) to get folks to have the numbers of their houses painted *on the large gas-lamps* now erecting *over* the door of nearly every private house. We shall *then* be able to *see* what the additional light conceals from the poor old cabmen, who must get down now to *find* out the right house. S.

FLUSHING SEWERS.

IN the autumn of last year you gave a description of a flushing apparatus for cleansing water-closets. On reading the description, it occurred to me that it would be equally effectual in cleansing pipe sewers. About two months before resigning the surveyorship of the Croydon Local Board, I had an iron tilting cistern, to hold 90 gallons, inserted in a brick pit, at the head of a pipe sewer. The tap was so set that the whole contents of the cistern were discharged every day at a fixed time instantaneously into the sewer. The effect has been so good, that I have no hesitation in recommending the insertion of this flushing apparatus wherever pipe sewers are used. The cost was as follows:—

Cast-iron cistern	£2 10 0
Brass bearings and plates, brickwork to pit, and stone-cover, water-tap, &c.	6 0 0
	£8 10 0

In any large town if a flushing cistern was fixed at the upper end of each line of sewers, and the taps so set that the discharge would take place in all at the same time, there would be sufficient water flow, not only to flush each line of pipe sewer, but also effectually to cleanse the main sewer into which they delivered their contents. It would only require a proper regulation of the tap to flush the sewers either once a day, or at any greater interval. It does not require the water to be always on, provided it is on once during the time that the flushing is required to be done. As no attention would be requisite, I think that wherever this plan is put into operation, a more effectual self-acting flushing apparatus could not be adopted. JAMES FENTON.

* We are not able to assent to this. And we may remind our correspondent as to the objection above, that the theatre was built for the representation of ancient plays in the ancient manner,—whether wisely or not is another matter. ED.

"LUDGATE HILL."

ATTENTION has been much turned of late to the improvement of Holborn-hill and Skinner-street, and it would now seem to be decided that nothing short of a level street, instead of the existing steep inclines, will suffice.

Why has the steep gradient of the neighbouring Ludgate-hill, apparently escaped notice? In connexion with Fleet-street, it constitutes another main artery of traffic, east and west, as important as Holborn-hill and Skinner-street. Can nothing be done to render its present steep incline less dangerous? Were the corresponding one in Fleet-street equally abrupt, should we not hear the same complaints that we now do of Holborn-hill and Skinner-street?

Why should not the whole line of street occupying the valley of the Fleet, from south to north, be raised, bodily or gradually, from Blackfriars Bridge? Were this done, the levelling, or, at any rate, the great improvement of the gradients of Ludgate-hill and Fleet-street would be the consequence. And more than this—it might then be found practicable to carry the much-deprecated railway *under* instead of *over* the main approach to St. Paul's Cathedral? TOO LATE?

LORD ST. LEONARDS ON RATING.

THE following portion of a letter recently written by Lord St. Leonards in a matter in which his lordship is personally interested, contains his views on the principles of rating, and may be useful to some of our readers:—

"As it will not be possible for you to come to a right conclusion upon the amount to which Boyle Farm should be charged to the poor-rate unless you are agreed upon the true construction of the Acts of Parliament by which we are all bound, I think it right to call your attention to what I consider the law on the subject: you will judge for yourselves how far you think I am right, and you can readily consult persons conversant with the administration of the poor-law. This is not a private letter, and I shall probably print it.

The Act which directs how the valuation is to be made is the 6 & 7 Wm. IV., c. 96, sec. 1, which declares a rate bad unless upon an estimate of the net annual value of the several hereditaments rated thereunto, that is to say, of the rent at which the same might reasonably be expected to be let from year to year, free of all usual tenant's rates and taxes and tithe commutation rent-charge, and deducting therefrom the probable average annual costs of the repairs, insurance, and other expenses (if any) necessary to maintain them in a state to command such rent.

This Act was explained by the 25 & 26 Vict., c. 103, sec. 15, which enacts that the gross estimated rental for the purposes of the Act shall be the rent at which the hereditaments might reasonably be expected to let from year to year, free of all usual tenant's rates and taxes, and the tithe commutation rent charge, if any—'Provided that nothing therein contained shall repeal or interfere with the provisions contained in the 1st sec. of the 6 & 7 Wm. IV., cap. 96, defining the net annual value of the hereditaments to be rated.'

The 6 & 7 Wm. IV., cap. 96, sec. 1, is therefore still to guide us as to the net annual value: that is quite clear. The 25 & 26 Vict. cleared up what might be deemed ambiguous in the former Act when it speaks of net rent only.

When, therefore, you have to estimate what gross rent a given property might reasonably be expected to let at from year to year free of all usual tenant's rates, &c., you have first to ascertain the gross annual value, and then to deduct from it the usual tenant's rates and taxes and tithe commutation rent charge, and the balance is the proper gross rental under the Acts of Parliament.

But the Acts go further: and when you have fixed the gross rental with the proper deductions, then to ascertain the net annual or rateable value, you are to deduct from it the probable average annual costs of the repairs, insurance, and other expenses (if any) necessary to maintain the property in a state to command such rent.

I think that the Acts of Parliament have not been understood. It was, for example, said that an unfurnished house would let better from year to year than upon a lease, because the tenant would not be liable to repairs: this of course does not apply to a valuation under the Acts, because the repairs are expressly directed to be deducted from the gross estimated rental.

Now then, to apply the law to the case of Boyle Farm. From the gross estimated value as before to be ascertained, the tenant's rates, taxes, and tithe rent charge are to be deducted. The Appeal Committee would not listen to the items, but, as made out by the actual payments, they amount (upon the 39*l.* and 247*l.* valuations; the old ones, that is up to the one in dispute) to 63*l.* 13*s.* 8½*d.*, and of course they would be largely increased by the new assessment if that is to stand.

When the tenant's rates, &c., are deducted, then in the words of the Act, there is to be deducted the repairs, insurance, and other expenses (if any) necessary to maintain the property in a state to command such rent. The insurance is 9*l.* 4*s.* 6*d.* The repairs during the last year, that is, from October, 1862, to October, 1863,

amounted to 10*l.* 2s. 1½d.: the annual expenses of keeping up the high road which is fixed by law on Boyle Farm, is about 20*l.*; and the annual average expense of keeping up the ground, including the taxes on the gardeners, is about 200*l.* In allowing for the deductions it should be kept in view that if the lawns, &c., are to be estimated in their present state, the expense of keeping them in that state must be allowed; for unless constantly mowed, rolled, and weeded, they would quickly become a waste, and certainly not in a state to command the estimated rent.

Mr. Castle, in his valuation, included the Paddock, which is simply pasture ground, and used wholly as such, and is upwards of four acres.

The expenses of the last year's repairs may be considered too high for an annual average, but it has been and always will be heavy; so the annual expenses for labour on the grounds might not all be allowed as a deduction, but a large portion undoubtedly should. I can by no computation, having regard to the Acts of Parliament, make the proper assessment on my property exceed the old assessment of 300*l.* gross, 247*l.* net—even if the annual value were to stand at 460*l.* In considering now how Boyle Farm should be estimated, you must necessarily look at the mode in which the other properties in the parish are valued. Twenty per cent. deduction has been allowed on houses like Boyle Farm, including the land assessed with them. . . ST. LEONARDS."

"P.S. I find my view of the Acts of Parliament exactly accords with that of a meeting of chairmen of parochial assessment committees held in Norfolk, as reported in the *Times*. Their resolutions were to the effect that—

'Gross estimated rental' is the rent at which property may reasonably be expected to let from year to year, the tenant paying the usual tenant's rates and taxes, tithe commutation rent charge, if any. That

'Rateable value' is the amount of the gross as above defined, after deducting therefrom the average annual expenses of repairs and insurance, with any other expense which may be necessary to put property in a state to command rent."

BAD LINSEED OIL AND TURPENTINE.

MY attention has been called to the repeated complaints of your correspondents respecting the adulteration of linseed oil, turpentine, &c. I beg leave to differ with your correspondent as to the cause altogether resting with the English manufacturers, as he asserts. I having had some years' experience in oils will, with your permission, endeavour to enlighten your readers as to the several causes of bad oil. In the first place it is a mistake to think that by going abroad we can be sure of having pure oil; the very fact of our exporting so much proves that our oils preferred by foreigners to their own; and having to compete with foreign adulterated oil has been one cause of the English crushers not being so particular as they ought to crush selected seed. It is well known that linseed is sold as a mixed seed, varying from 5 to 15 per cent. of wild rape and other seeds, which proceeds from the negligence (the mildest term I can use) of the growers in not weeding their grounds; and as the seed passes from buyer to buyer, no doubt it does not improve in quality before reaching the crushers in this country, who also have to contend with other difficulties, such as the seed becoming heated on the voyage which cannot always be avoided), but which renders the oil extracted from such seed totally unfit for varnish and painting purposes, although sold on the market as good marketable oil. The crushers, too, make every effort to extract the greatest possible quantity of oil from the seed, regardless of quality. I should like to go into full details as to how this is done did space permit, but must leave that to a future time. 2ndly. An immense competition exists among the dealers, who buy the *marketable* linseed oils, which term they consider a sufficient guarantee for the quality, not knowing or caring perhaps how it is crushed, their sole object being to buy as cheaply as possible so as to be able to compete successfully with their neighbours; and the retailer is in precisely the same position.

Being a practical man, this subject has engaged my attention for some years, and induced me to go to considerable trouble to find out the cause and provide a remedy. The cause is the prevalence of fatty matter in the oil. This I can, by a process entirely new, make the oil thus treated is particularly adapted for the purpose of varnish making and painting (at the same time being free from all oxides of lead), consequently can be used for the most delicate tints of colour, without in any way injuring them in the working: it also dries with a finer face than ordinary oil.

I will next treat of spirits of turpentine. This is also a most essential article, and one which must be absolutely pure for both varnish making and painting, and nothing is more easily adulterated, or detected when adulterated. I need not inform your readers that previous to the American war we could always depend upon the American turpentine; but now they are importing French-drawn turpentine from this country and also from France, so that it is a fallacy to depend on them for *genuine* American turpentine. A few years since the French turpentine was very inferior. The extreme margin, however, between the original price of turpentine and the price now has induced the French to improve their manufacture till we can now somewhat depend upon some being of a very fair quality. The introduction of *mineral* (or *petroleum*) spirits from America has, however, opened a wide field for adulteration, the evils of which cannot be too widely known, as I shall proceed to explain. Pure vegetable turpentine, upon exposure to the air, always loses in bulk by evaporation, but gains in weight by absorption of oxygen, which makes it more binding in its properties. This peculiarity *none* of the *mineral substitutes* possess; on the contrary, the mineral is so extremely volatile that, upon exposure, the spirit *all* flies off, leaving the oil entirely without anything to help to harden it, and consequently increases the evil of the bad oil, instead of counteracting it. A. M.

THE DARGAN TESTIMONIAL.—The statue of William Dargan was on Tuesday placed upon its pedestal, on the lawn of the Royal Dublin Society, in front of the National Gallery of Ireland, at the west side of Merrion-square. The National Gallery will be opened to the public at the beginning of the ensuing year.

Books Received.

Gazette des Architectes et du Batiment, Nos. 1 *to* 14. 15, Rue Bonaparte, Paris.

THIS publication, which constitutes the second series of the *Encyclopédie d'Architecture*, is published twice in the month, and is under the direction of M. Viollet-le-Duc, jun., and M. Corroyer. It is quarto in size, and is very fully and cleverly illustrated with sketches, chiefly of details. Subscribers to the *Revue d'Architecture* obtain it at less cost than others. We confine ourselves on the present occasion to this notification of its aspect, and the remark that it deserves the attention of the profession in this country. When an opportunity occurs we will give a fuller account of its usual contents.

Miscellanea.

THE ROYAL ACADEMY.—Mr. Millais and Mr. Cooke are the new "R.A.s."

HEAT ON SALE.—An American paper states that a scheme is under consideration for warming houses from a central source, and supplying citizens with heat as gas is now supplied.

CAMBRIDGE.—The new museum at Cambridge is about being covered in. It stands in a large enclosure, and is surrounded with rich foliage. Messrs. Geo. Smith & Co. are the builders. The material used is Little Casterton freestone.

FIRE AT WINDSOR CASTLE.—A fire has occurred in the Prince of Wales's Tower, near her Majesty's private apartments and the eastern end of the north terrace of Windsor Castle. A good supply of water soon extinguished the flames, without causing the slightest alarm to the Queen or doing any material damage to the tower and its contents. The fire was confined to the roof.

THE CLARENCE HOTEL, DOVER.—The foundation-stone of this new hotel, of which we gave an engraved view on the 6th instant, has now been laid. Mr. J. Kirke, of Woolwich, the Government contractor, has taken the contract. Mr. Alfred Smee, the chairman of the company, invited the visitors present to a refreshment at the town-hall, after the laying of the stone by Lord Sondes.

WATER SUPPLY TO JERUSALEM. — Mr. J. I. Whitty, C.E., has been commissioned to estimate the cost of supplying Jerusalem with water. He argues that there can be little difficulty in providing for the wants of the present population, which amounts to only 20,330, their habitations occupying 213½ acres; and he calculates that for constructing a main sewer, repairing cisterns, forming drains, and restoring Herod's aqueduct from Solomon's Pools, a greater sum than 8,479*l.* would not be required; while the most essential part of the works might be completed for 4,986*l.* If there be a charitable work about the utility of which there can be no dispute, it is that which would cleanse and beautify the most celebrated city in the world, and restore health to its inhabitants. Important archæological discoveries, too, might be incidentally made while excavating for the drainage and water supply.

BROMSGROVE SCHOOL OF ART. — The third annual meeting of the subscribers and friends of this institution was held in the assembly-room of the Literary and Mechanics' Institution, at Bromsgrove, when a large number, ladies as well as gentlemen, attended. Dr. Collis, head-master of the grammar-school, presided. The report referred to the continued progress and increasing prosperity of the school. The total number receiving instruction in drawing had been 246: this number included 160 from the National school, and 86 in the Central school, showing an increase of 15 over 1862. At the annual inspection and examination of the school in October last, by the Government inspector, Mr. Wylde, six bronze medals were awarded to students. The total number of prizes this year was thirty-nine, an increase of eight over last year. In establishing the school, the object of the committee was to make it self-supporting, and they were glad to say that the financial condition of the school would bear a favourable comparison with any school of art in the kingdom. After paying all liabilities, the balance in the hands of the treasurer was 8*l.* 4s. 4d., as against 1s. 11d. last year. The committee congratulated Mr. Bowen on his appointment as head-master of the Stourbridge School of Art; but the students of the Bromsgrove school would still have the benefit of his services.

LARGE CASTINGS.—Four castings in green sand, of unusual magnitude, have recently been successfully made at Messrs. Hicks & Sons', Soho Ironworks. Two comprised a press top and bottom for Government, each weighing twenty tons. Another was part of an anvil block, weighing twenty-five tons, and the fourth was the remaining part of the anvil block, weighing forty-two tons. This anvil block was made for the use of the Bolton Steel Company. The metal was poured into the moulds from enormous ladles, in presence of a large concourse of spectators.

FLOW OF WATER AT THE ARTESIAN WELL AT DONCASTER.—Mr. Dale, the Waterworks engineer, states that the bore which is being made at the bottom of the pumping-shaft at Spring-head having penetrated a horizontal fissure 4 inches in depth, a large flow of water immediately rushed into the shaft; and, notwithstanding the Jackson engine was pumping at the rate of 3,000,000 gallons in the 24 hours, the water in the shaft rose in ten minutes from 10 feet to 20 feet. Mr. Dale estimates that the present yield of water is at least 4,000,000 gallons in the 24 hours.

MR. G. CUBITT IN ISLINGTON.—A committee of gentlemen, formed to enlarge the temporary iron church of St. Clement's, Barnsbury, having applied to Mr. G. Cubitt, M.P., for his assistance, he munificently offered to endow the district with 150*l.* a year (5,000*l.*), and afterwards expended about 4,000*l.* in enlarging the site for the church and purchasing a parsonage, and has now further offered to provide a permanent free church entirely at his own expense, from designs by Mr. Scott, at a cost of 7,000*l.*, provided the incumbent, the Rev. J. K. Harrison, and the committee, will erect suitable schools, for which they are in great need of funds.

DOUBLE WAGES NO ADVANCE.—A contractor in the Scottish Highlands, says a contemporary, was waited upon by a deputation from his workers, to request him to make "no a pit o' difference in the wages, but shust a wee shynge in the time for paying." On cross-questioning the deputies, he found they wanted to be paid weekly instead of fortnightly, but they also wanted the fortnight's wages weekly. "Why, my lads," said the contractor, "you are just demanding exactly double wages." "Hoots, no sir!" said one of the deputies, "it's shust as more as less as the same wedges, put you must shust paid us twice as faster as evermore." After a little parleying, the contractor got his Celtic logicians to resume work at a trifling advance.

BARRACKS, EDINBURGH CASTLE. — We learn from the newspapers that the War Department have obtained plans and accepted tenders for the reconstruction of the north barracks, which were dismantled some years ago to make way for projected improvements which were not carried out. The approved designs are by Mr. Billings. The parallelogram of the original building is recessed in the centre, throwing out wings on the east and west with projecting facets crossing the opposing outer angles. The building is three stories high, and on each story will be two large barrack-rooms. The walls will be topped by turret and battlement. The amount of the tender is 4,100*l.*, exclusive of the fittings for heating and ventilating the rooms, which will be supplied by the War Department.

SAILORS' HOME, WELL-STREET, LONDON DOCKS. At a meeting of the directors, held at the institution on the 10th inst., Captain the Hon. Francis Maude, R.N., in the chair, the secretary reported that the unusually large number of 1,070 seamen had passed through the Home during the month, and justified the directors in making the necessary preparations to meet extraordinary demands by enlarging the buildings, which work is now in progress. The monthly accounts were laid before the Board, and showed that 9,308*l.* 15s. 2d. had been received from sailors, and 4,271*l.* 16s. 2d. remitted to their friends. The cost of the new building, without fittings, &c., will be 10,626*l.*

THE GREAT EASTERN.—At Liverpool, some of the creditors of this unfortunate ship have been considering the propriety of forming a company for its purchase, or its disposal by lottery. It was stated, on counsel's opinion, that measures could be taken to sell the vessel by lottery distribution, in 200 prizes, ranging from 20,000*l.* to 250*l.* The scheme, however, if adopted, would have to be practically carried out at Frankfort-on-the-Maine, though the shares would all be held in England. The "new company" scheme is virtually abandoned. Is it not strange that this great ship has never yet been tried on long voyages, as to and from India or Australia? Surely short voyages for the long ship were unlikely to pay.

Liverpool Architectural Society. — The fortnightly meeting of this society was held on Wednesday evening, the 16th inst. Mr. Joseph Boult presided. Mr. G. A. Audsley read a paper on "The Art of Ornamental Design."

Corn Exchange, Stamford.—Having alluded to this building in our recent article, "The Critical State of Stamford," we are asked to mention that the decorations were executed by Mr. W. Rubarett, of London, under the superintendence of the architect, Mr. Edward Browning.

Ely Surveyorship.—Letters have been received from twelve applicants, and the clerk was requested to invite the following candidates to wait upon the Board, whose expenses should be paid, viz, Mr. A. Deawney, Mr. S. Mather, Mr. Alfred Harrison, Mr. Alex. Keyle, Mr. J. A. Downes, of whom the Board will make choice of one. Our readers will recollect a letter on this subject which appeared recently in these pages.

Accident at New Liverpool Waterworks. On Monday afternoon, as some men were employed in working at the foundation of one of the pillars which supported a number of arches constructed for the purpose of carrying some portions of the new Liverpool Waterworks, near the junction of Dudley-lane with the Woolton-road, the pillar suddenly gave way, carrying with it five of the arches. In their fall they severely injured a number of the workmen, who were carried to the Royal Infirmary.

The Fire in the City.—The destruction of property between Wood-street and Milk-street, City, makes evident the value of attention to the requirements of the Building Act, in respect of party walls and iron doors in them, where buildings are thrown together. Had the stuctures that are burnt been divided by proper party-walls, instead of the thin partitions of early days, the fire would have been confined to a very small area, and the destruction of an enormous amount of property would have been preventcd.

Society of Engineers.—The annual dinner of this society was held at the Bridge House Hotel, on the 17th. Mr. R. M. Christie, the president for the past year, occupied the chair: Dr. Riley (one of the past chairmen), and Mr. Alfred Williams (hon. sec.) were vice-chairmen. The Chairman, in proposing the toast of the evening, "Success to the Society of Engineers," drew attention to the fact, that the institution had been established for a period of ten years, during which it had continued to progress. There could be no doubt that the periodical meetings which were held for the reading of papers upon engineering and scientific subjects, and the discussions thereon, had proved of the greatest benefit.

Charity under Difficulties.—Mr. John Hutchinson, of Sunderland, is about to add another to his many acts of benevolence, by the erection and endowment of an almshouse for twenty inmates. Mr. Hutchinson has issued a handbill, stating that an attempt is being made by some of his family to prevent him carrying his intention into effect; and one of his sons, a solicitor, has intimated his intention of applying to the Lord Chancellor to have him declared insane, and incapable of managing his own affairs. He appeals to all with whom he has done business for many years, whether such is the case.

Removal of St. Thomas's Hospital.—A numerously attended deputation from the parishes of St. Saviour's and St. George's Southwark, St. Mary's Newington, Bermondsey, and Camberwell, and from the corporation of London, waited on Friday afternoon upon Sir Roundell Palmer, M.P., the Attorney-General, for the purpose of representing to him the impropriety of giving his sanction to the suit now pending before Vice-Chancellor Page Wood, regarding the erection of St. Thomas's Hospital on the Stangate site. In course of the interview, Mr. Rendle, of St. George's, Southwark, said he had addressed letters to all the chief medical men on the south side of the Thames, to the number, he thought, of 119; and from 107 of these gentlemen he had received replies condemning the Stangate site as altogether unfitted for the purpose. Mr. Tite, M.P., on the part of the governors of the hospital, justified the course they had adopted. The whole of *their* medical officers, he said, had expressed a favourable opinion on the point. The Attorney-General said the representatives of the parishes would be incurring unnecessary expense in going before the Vice-Chancellor by counsel in the matter, but should the City corporation satisfy the Vice-Chancellor as to *their* right to appear, he should not object to their having a *locus standi* in the matter.

Sale of the Staveley Collieries and Ironworks.—These works, at Chesterfield, Derbyshire, employing upwards of 3,000 workpeople, &c., have just been sold to a joint-stock company, through Messrs. Chadwick, Adamson, & Co., financial agents. The value of the property exceeds half a million sterling, and the amount of the capital was all privately subscribed in Manchester in three days only.

Memorial of Dr. Smith, Doctor of Music to the University of Dublin.—A meeting of the committee was held a few days ago, at the Ancient Concert-rooms, for the purpose of choosing a design for the memorial window about to be erected to the late Dr. Smith, in St. Patrick's Cathedral, when an artistic design by Messrs. Clayton & Bell, of London, was selected (from several which had been furnished to the committee), for the approval of the Dean of St. Patrick and Mr. Benjamin Lee Guinness.

Grand Conclave of Knights Templar and Hospitallers of St. John of Jerusalem.—A new Masonic hall has been erected in the rear of the premises, No. 14, Bedford-row, and was opened last week. The construction of the roof appears ingenious. Mr. H. W. Spratt was the architect. The Templars make claims which it seems the general body of the "craft" decline to recognise.

Art Sales in Paris.—At a recent sale, in the Hôtel des Ventes, of drawings which served for engraving works in the galleries of Versailles, a copy, by M. Massard, of Horace Vernet's picture of "The Taking of the Smala," was purchased for 5,050fr. At a sale of curiosities, a pair of firedogs, of the period of the Renaissance, fetched the large sum of 7,200fr. These latter were more than three feet high, and, according to *Galignani*, are masterpieces of ornamental ironwork.

Newstead Priory and Hospital.—Near the site of the ancient and once famous Priory at Newstead there have just been discovered some interesting relics. They were bared by labourers employed in making a new carriage-drive from the Uffington road to the Earl of Lindsey's residence in the Park. These relics consist of a portion of a statue, representing a warrior of the time of Henry III., as exhibited in the chain mail of that period; an ancient freestone floor, probably part of an ambulatory; a great quantity of window tracery of the fourteenth century; and some small jamb shafts of the thirteenth century.

Ironmongers' Association.—A lecture in connexion with this association was delivered on Wednesday, the 16th inst., at the Whittington Club, by Mr. A. B. Midlane, on "the Science and Practice of Electro-Metallurgy." Many fine examples of the art were exhibited in the room, through the kindness of Messrs. Elkington & Co., Messrs. Kennard & Co., and the General Foundry Company. The next lecture of the season will be delivered at the same place by the Rev. C. Boutell, M.A., the subject being "the Metal-work of the late Exhibition." It is satisfactory to find an association like this endeavouring to give a knowledge of matters pertaining to the business of its members.

Another Park for the Metropolis.—The Metropolitan Board having given notice of their intention to apply to Parliament to form a park in the parish of Rotherhithe, on the confines of Bermondsey, a meeting of delegates of South London parishes has been held, the vestries of Camberwell, Rotherhithe, St. George the Martyr, and the District Board of St. Olave being represented; and it was resolved, "That it is the opinion of this meeting that the plan projected by the Metropolitan Board of Works for the formation of a park at Rotherhithe, will be for the benefit of the inhabitants of the eastern and south-eastern districts of the metropolis, and that such plan is entitled to the active support of the parishes represented at this meeting."

Alterations in the Main Drainage Works at Crossness.—Mr. Bazalgette, the engineer, has recommended certain alterations in the mode of constructing the river wall and reservoir at the outfall of the southern main drainage works at Crossness. In consequence of the mud being much deeper at this point than was anticipated, the engineer recommends the use of iron cylinders in lieu of the timber piling originally proposed. The cost of the additional work is estimated at 9,900*l*. The bottom of the reservoir also must be arched and inverted in brickwork, instead of being concreted and flagged. The estimated cost of this additional work is 8,500*l*. The Board has authorized the execution of these works as extras on the contract, at an estimated cost of 18,400*l*.

Proposed Statue to the late Prince Consort.—The statue to be erected in the Marketplace, Wolverhampton, by Mr. Thorneycroft, the sculptor, is at once to be proceeded with by that gentleman.

Mr. Henry Leslie's Concerts.—Mr. Leslie's choir announce five subscription concerts in St. James's Hall, aided by Madame L. Sherrington, Mr. Sims Reeves, Madame A. Goddard, M. Lotto, and others. The first was given on the 17th, and included the performance of Spohr's "Ode to St. Cecilia," and several new madrigals and songs by Mr. H. Smart, Mr. J. G. Callcott, and Mr. Leslie himself. Madame Lemmens Sherrington was the principal singer, and delighted her audience. Herr Blumner, whose merits as a pianist are becoming widely known, caring more for the art than for a prevailing public opinion, selected, amongst other pieces, the March from Wagner's "Tannhäuser," and played it with great ability. Paganini's "Witches' Dance" was executed on the violin with wonderful brilliancy by M. Lotto.

The Charing cross Railway.—Captain Tyler, the Government inspector, in company with Mr. Hawkshaw, has renewed his inquiry into the condition of this line, and tested the numerous iron road-bridges that carry it from the Charing-cross Bridge to the London Bridge terminus. The structures, it is said, were severally tested with weights equivalent to a ton per foot on each line of rails, the general average deflection being only half an inch on the centres and a quarter of an inch on the cross girders. The ugly iron plate girder-bridge at the London Bridge end is the largest structure of its kind, extending over a total span of 186 feet, and weighing upwards of 300 tons. The bow and string bridge over Southwark-street has a span of 132 feet in the clear. The Princess Royal and her husband, the Crown Prince of Prussia, were the first of the public to travel on this line.

The Aston Park Scandal at Birmingham. The truth of the exposure we assisted, at the cost of some abuse of us, in making, as to the Aston Park sham purchase, after her Majesty had been induced, by false pretences, to grace the opening of the "People's Park," in 1858, has now come out more glaringly and disgracefully than ever. When the Mayor of Birmingham for the time being invited her Majesty and Prince Albert to open the park, not 10,000*l*. out of the 40,000*l*. required for its purchase had been raised, nor could there have been the least prospect of its being raised. Indeed, not much more than the 10,000*l*. has ever been raised even yet for any such purpose; and there are still 28,000*l*. due on the falsely alleged purchase, which is no purchase at all; so that the People's Park at this moment runs the imminent risk of falling back into the hands of those who were to have reaped an enormous profit by the sale of it. It is the sound advice of their own local papers, that the corporation had better make the best of a bad business in the present instance, by completing the actual purchase of Aston Park; and this they should do without any more higgling or any more delay; and the more quietly the better; so to shut up a most shameful affair, which they ought never to have allowed to reach the ears of the public at all.

TENDERS.

For new warehouse in Greyhound-yard, West Smithfield. Mr. A. E. Taylor, architect. Quantities supplied:—

Macers	£2,095 0 0
Higgs	2,057 0 0
Ashby & Sons	2,034 0 0
Henshaw	1,932 0 0
Killby	1,900 0 0

For tavern at Hampton-hill, S.W. Mr. W. Wigginton, architect:—

Wheatley	£2,143 0 0
Bond & Co.	2,105 0 0
Pearson (accepted)	1,814 0 0

For new Music hall, Commercial-street, Shoreditch. Mr. R. H. Moore, architect:—

Patman & Fotheringham	£12,860 0 0
Myers & Sons	12,548 0 0
Carter & Sons	10,670 0 0
Downs	10,554 0 0
Randell & Stap	10,250 0 0
Little	10,137 0 0
Hill, Keddell, & Co.	7,719 0 0

For building a new Independent Chapel at Bowling, near Bradford, Yorkshire. Messrs. Paull & Ayliffe, architects. Quantities supplied:—

Plugworth & Son (accepted)	£2,384 0 0

For a new public-house to be built in the Manchester-road, Isle of Dogs, for Mr. Smallman. Messrs. Hamnock & Lambert, architects. Quantities supplied:—

Turner & Sons	£1,824 0 0
Gilson	1,795 0 0
Ranken	1,597 0 0
Hedges	1,458 0 0

TO CORRESPONDENTS.

T. G.—Philant (Parian cement is most commonly used).—One who was present.—Messrs. C. & Co.—C. & B.—*Quam dilecta.*—J. E. (there is no misapprehension on our part).—J. G.—Architectus (it is useless proposing enlarged views and wider scope to the Institute of Architects under its present government: the tendency, unfortunately, is in quite the opposite direction).—J. M.—R. D.—W. E. N.—F. E. H.—M. H.—Taxpayer.—W. B.—W. W.—P. & A.

We are compelled to decline pointing out books and giving addresses.

All statements of facts, lists of tenders, &c., must be accompanied by the name and address of the sender; not necessarily for publication.

TO SUBSCRIBERS.

CLOTH CASES for binding the Volume of the present year are NOW READY, and may be had at the Office.

Price Two Shillings and Ninepence.

Shortly will be Published, in Cloth Boards,

ANOTHER BLOW FOR LIFE.

BY GEORGE GODWIN, F.R.S.

With Forty Illustrations.

W. H. ALLEN & CO. Waterloo-place.

[ADVERTISEMENTS]

CHRISTMAS PRESENTS.—Elegant copies of Letts's Diaries or Housekeepers in their many varieties, Pocket-books of various leather, Letts's Boudoir Writing Desk, Letts's Reading Easel, Letts's complete sets of Sermon Register, Sermon Books, Sermon Case, &c.; Library Catalogues, Ordnance Map of Hunting Districts, Riding, Driving, &c.; Atlases, Globes, &c. Catalogues post-free.—LETTS, 8, Royal Exchange.

TIME! TIME! Nothing so valuable as time. Any Bookseller will supply you on asking for a Letts's Gratis Almanack, wherein are described a vast variety of Works, all expressly devoted to this one object; such as Diaries, Almanacks, Housekeepers, Registers of various subjects, Portable Copying Machines, &c. Catalogues post-free. LETTS, 8, Royal Exchange.

HOROLOGICAL PRODUCTIONS.—"Ranged around the base of the clock were the Watches which Mr. BENSON exhibited, and which have been universally admired for the beauty and elegance of the designs engraved upon them. The movements are of the finest quality which the art of horology is at present capable of producing."—*Illustrated London News*, November 8, 1862. Chronometer, duplex, lever, horizontal, repeaters, centre seconds, keyless, split seconds, and every description of watch, adapted to all climates. BENSON'S Illustrated Pamphlet on Watches (free by post for two stamps), contains a short history of watchmaking, with prices, from 3 to 200 guineas. It acts as a guide in the purchase of a watch, and enables those who live in any part of the world, to select a watch, and have it sent by post. Prize Medal and Honourable Mention, Classes 33 and 15. J. W. BENSON, 33 and 34, Ludgate-hill, London. Established 1749. Watch and Clock Maker by Special Warrant of Appointment to H.R.H. the Prince of Wales.

PEDESTAL HOT AIR STOVES.—A number of Pedestal Stoves, suitable for school-rooms, warehouses, churches, &c., manufactured by the late Mr. Pierce, to be sold at a low price. One Stove is of very large dimensions, and is entirely covered with majolica tiles. The Stoves will be sold separately, in perfect condition. They have all been removed from a public building where extensive alterations have taken place.—Apply to Messrs. EDWARDS & SON, 49, Great Marlborough-street, Regent-street; or at their Factory, 86½, Oxford-street.

ADVERTISEMENTS.

VIRTUE, BROTHERS, & CO., 1 Amen Corner.

NEW SERIES OF

CHAMBERS'S JOURNAL commenced in 1832—the first cheap periodical in which an attempt was made to present Original Literature of a high class—CHAMBERS'S JOURNAL has persevered in its plan and design to the present time. It has been the constant aim of its Conductors to elevate, as well as to amuse, apart from all sectarian or controversial subjects, and there is good ground for believing that, after an existence longer by many years than that of which any popular periodical can boast, the objects have been to some extent attained. Roundly speaking, TEN THOUSAND ORIGINAL ARTICLES, embracing a prodigious variety of subjects, have appeared; yet the field of observation and discussion seems practically indefinite. By a scrupulous attention to certain unvarying principles of management, the Proprietors have been so fortunate as to procure for their paper a circulation

CO-EXTENSIVE WITH THE PREVALENCE OF THE ENGLISH LANGUAGE.

Encouraged by the success which has attended their efforts, Messrs. CHAMBERS are leaving no means unemployed to render their Journal more attractive still; and in arranging for the carrying out of certain important changes in

THE FOURTH SERIES,

to be commenced in January, 1864, they have endeavoured to provide for the tastes of two large sections of their readers, first, those who consider a serial tale the desirable feature of a periodical, and second, those who don't. To cater for the first section, the Proprietors have succeeded in obtaining an interesting original story, entitled

LOST SIR MASSINGBERD,

the first portion of which will appear on January 2, 1864. For the second section, as well as for readers in general, the literary matter will be improved in various ways. Matters of Current Public Interest will be ably and concisely treated; the Best Books of the Day will be impartially reviewed; Occasional Notes, as in the older volumes of CHAMBERS'S JOURNAL, will be revived; Carefully Selected Poetica. Pieces will be added; Miscellaneous Articles of an interesting, as well as instructive nature, will continue to appear; while amongst other Mechanical changes, the principal portions of the Journal will be printed in a

LARGER AND MORE READABLE TYPE,

so as to suit the eyesight of the oldest subscribers. The Publishers have also to announce, that they have prepared, and are now issuing, an Extra double New-Year's Day Number, entitled,

IN THE BOX,

consisting of a number of interesting tales, arranged in a method quite original. This double number (the price of which is 3d.) is issued distinct from the Journal itself, and may be purchased independently of that periodical. It will, however, be done up in the Monthly Part published at the end of December, the price of the Part including an Index and Title-page to Vol. XX. and the New-Year's extra Number—being One Shilling.

For those who may wish to complete sets of CHAMBERS'S JOURNAL, the following information may be useful:—The SECOND SERIES (1844 to 1854), in 20 vols. is still on sale, at 9s. cloth. The THIRD SERIES, now completed, may be had either in 20 vols. cloth, at 9os.; or in Weekly Numbers, for binding according to the taste of the purchaser, at 7s.

CHAMBERS'S JOURNAL may be ordered weekly, at Three Halfpence; monthly, at Sevenpence; or in Half-yearly Volumes, at Four Shillings and Sixpence, from any bookseller or newsvendor in the United Kingdom or Colonies.

Back Numbers, Volumes, and Cases for binding, constantly kept by the Publishers.

W. & R. CHAMBERS, 339, High-street, Edinburgh, and 47, Paternoster-row, London.

Now ready, with 10 plates, roan tuck, price 6s. (postage 4d.)

THE ENGINEER'S, ARCHITECT'S, AND CONTRACTOR'S POCKET BOOK (LOCKWOOD'S, formerly WEALE'S) for 1864. The present volume has been considerably improved, and much new matter added

LOCKWOOD & CO. 7, Stationers' Hall-court, E.C.

Now ready, 12mo. strongly bound in cloth, price 4s. (postage 4d.),

THE BUILDER'S and CONTRACTOR'S PRICE BOOK (Lockwood's, formerly Weale's) for 1864.

Revised by G. R. BURNELL, Esq. C.E.

This book is the universally recognized arbitrator in the settlement of disputed accounts. Not being printed from stereotype plates year after year, as is the case with other books of the kind, errors are not perpetuated, and the opportunity is taken in every reprint to introduce current prices and other desirable improvements.

LOCKWOOD & CO. 7, Stationers' Hall-court, E.C.

SPECIALLY ADAPTED FOR CHRISTMAS AND NEW YEAR'S GIFTS.

DR. FLETCHER'S GUIDE to FAMILY DEVOTION.—A sale of 100,000 copies induced the Author to improve and enlarge the Work. It comprises 731 services, each including a Hymn, Prayer, Portion of Scripture, and appropriate Reflections, being one for the Morning and Evening of every day in the year. Also an Appendix, containing Prayers for Particular Occasions. 1 vol. royal 4to. 26 Engravings, 25s. cloth gilt.

*** This Work may be had in Nos. and Monthly Buildings.

London: JAMES S. VIRTUE, City-road, and Ivy-lane.

MANUFACTURER of the best Cowley Stocks, Yellow and White Cutters, Yellow and White Seconds, Paviors, Pickings, &c. Delivered in the River, or in the Grand Junction, or Regent's Canal; or in trucks to any part of the Great Western Railway
BRICKFIELDS, NORTH HYDE, NEAR SOUTHALL.

BRICK BURNING, saving Two-thirds of the Fuel—HOFFMAN'S PATENT ANNULAR OVENS, for the continuous burning of Bricks, Tiles, Pottery, &c. can be seen in action, and every information obtained on application to Mr. H. CHAMBERLAIN, 3, St. John's, Wakefield, Yorkshire.

TO BRICKMAKERS.—All Parties who BURN BRICKS in CLAMPS are invited to inspect the NEW MODE of SETTING, patented by Mr ROBERT WHITE, and which may be seen in operation at the Brickfields at the Hoo Junction.
J. B. WHITE & BROTHERS, Erith, Kent.
The advantages of this plan are two-fold.
1st. Nearly all the bricks are burnt into stocks, and the yield of inferior bricks is reduced from 35 to about 10 per cent of the total make, which in itself represents a large permanent saving.
2nd. The bricks are so much improved in colour and soundness as to give them a considerable additional value in the market over common stocks.
Licenses for use of the Patent granted to Brickmakers, on application to the Patentees, 17, Millbank-street, Westminster.

BURHAM BRICK, LIME, and CEMENT COMPANY, BURHAM WHARF, BELVIDERE-ROAD, LAMBETH.—The public are informed that the Company have taken the above Premises, and have NOW ON SALE, HAULT BRICKS, TILES, POTTERY, DRAIN-PIPES, GREY STONE LIME, PORTLAND and other CEMENTS, and BUILDING MATERIALS of all descriptions. Architects and Builders are respectfully informed that goods of any pattern or design can be manufactured at the Company's Works, erected on the banks of the Medway by the late Thomas Cubitt. They would also call the attention of the public to the very superior quality of their Portland Cement.

SPRING GROVE BRICKFIELDS, HOUNSLOW, W. MIDDLESEX.—Mrs. ANN ELIZABETH BURCHETT begs to thank her numerous friends for the patronage received during the last twenty-five years, and having DISSOLVED PARTNERSHIP with her son, Mr. JAMES BURCHETT, has again OPENED the above BRICKFIELDS on her own account, where by strict attention to all orders she trusts to receive the same encouragement hitherto so liberally bestowed upon her. Office—Caswell Cottage, Hounslow-road, Hounslow, W.

FIRE-PROOF CONSTRUCTION.—
FOX & BARRETT'S PATENT.
This improved system of fire proof construction has been most extensively accepted, and its application has been extended to nearly EVERY DESCRIPTION OF BUILDING, whether public or private.
The system combines ECONOMY with great simplicity of construction, perfect security from fire, increased durability, and many other important advantages.
The floors and roofs are formed by a combination of joists of wrought or rolled iron with concrete, so constructed that each floor becomes in effect a beam of artificial stone with ribs of iron; the structure possessing great strength and rigidity, and forming a fire-proof foundation adapted to receive a finished surface, either of the ordinary flooring boards, or of cement, asphalte, tiles, slate, or other material.
Some of the largest and most important buildings in the kingdom are now in course of erection upon this principle, which is recommended to the notice of all who are interested in building, both as superseding the necessity for cast-iron girders and brick arches, and as bringing the great desideratum of fire-proof construction, even for ordinary dwelling houses and domestic buildings, within the reach of every one.
Further information may be obtained of the Proprietor of the Patent,
MR. BARRETT,
12, YORK BUILDINGS, ADELPHI.

SMOKY CHIMNEYS.—The best Cure is the PATENT ALBERT CHIMNEY CAP, 200 on Rocking-horse Palace, in use also at St. James's Palace, Windsor Castle Government buildings, mansions, hotels, public houses, and buildings in general. Price-lists on receipt of two postage stamps.
JAMES BARTON,

SMOKY CHIMNEYS.
S. DEACON
Respectfully invites the attention of Architects, Builders, &c to his
PATENT LOUVRE CHIMNEY CAP,
which has been in use some time with perfect success, many chimneys where other caps have been of no avail
The advantages attending this Cap are—it can be thoroughly cleaned by the machine when the chimney is swept, the brush being able to pass through the Cap without the liability of misplacing it; also increased draught, and the impossibility of a down one.
Prospectus forwarded on receipt of Postage Stamp, by
S. DEACON,

DAVID JONES, Bridge Ironworks, and HERBERT'S Park Ironworks, Bilston, Staffordshire, Manufacturer, under Licence of the Patentee of MALLET'S PATENT BUCKLED IRON PLATES, for flooring, for railway and other bridges, viaducts, wharfs, &c and for flooring and other parts of fire proof buildings, and various important structural uses. These plates form the lightest, strongest, most rigid, and durable flooring known. They were pronounced by the late Mr. Brunel, "the best bridge-flooring extant." They have been adopted at the new bridge, Westminster, on the Indian railways, and in many other first-class structures, by Messrs. Page, Hawkshaw, Rendell, Stephenson, and other engineers, and for fire-proof buildings by Government, the War Office, Metropolitan Board of Works, and other important uses. Specimens of the buckled Plates can be seen at Bull-wharf Upper Thames-street, London.—Applications for lithograph circulars, prices, and other information, as to supply of the plates to be made to the Manufacturer, as above; or to ROBERT MALLET, Esq. C.E. the Patentee, 11, Bridge-street, Westminster.
N.B.—Manufacturer of Boiler Plates, Bridge and Ship Plates; also Sheet Iron of all kinds, and Rivet Iron of first quality.
Address, BRIDGE IRON WORKS, Bilston, Staffordshire.

Lists of Prices on application.
3, GREAT TURNSTILE, HOLBORN, LONDON, W.C.
Price 2s 6d post free,
STANLEY'S IMPROVED DRAWING PEN

GUTTA-PERCHA MILL-BANDS.—The
Gutta-Percha Company beg to state that the increasing demand for the Gutta Percha Strapping for Driving bands, Lathestraps, &c. fully justifies the strong recommendations they have everywhere received. Their durability and strength, permanent contractability and uniformity of substance; their non-susceptibility of injury from contact with oils, grease, acids, alkalies, or water; and the facility with which the only joint required can be made in bands of from 200 to 300 feet long, render them superior to leather for almost all working purposes, and decidedly more economical. Every variety of Gutta-Percha Articles, such as Tubing, Soles, Pump-buckets, Fire-buckets, Bosses, Union joints, Flasks, Bottles, Bowls, Inkstands, Toilet trays, Curtain-rings, Galvanic Batteries, Tailpotype Trays, &c. manufactured by the Gutta-Percha Company, and sold by their Wholesale Dealers in town and country.
THE GUTTA PERCHA COMPANY, PATENTEES,
18, WHARF ROAD, CITY ROAD, LONDON.

TO ARCHITECTS, BUILDERS, RAILWAY CONTRACTORS, AUCTIONEERS, &c.—SPECIFICATIONS, CONTRACTS, ACCOUNTS, and every other description of DOCUMENTS, correctly and expeditiously COPIED, at 1½d. per folio of seventy-two words, by FRY & SON, Law Stationers, Printers, and Lithographers, 13 and 14, South-square, Gray's-inn, W.C. Plans and drawings copied, enlarged, or reduced, on reasonable terms.

STAINING DEAL TO IMITATE ALL KINDS of WOODS. It requires NO SIZING, and will stand exposure to the weather. LIFE DEPARTMENT.—Under the provisions of an Act of Parliament, this Company now offers to new Insurers EIGHTY PER CENT OF THE PROFITS, AT QUINQUENNIAL DIVISIONS, OR A LOW RATE OF PREMIUM without participation of Profits.
Since the establishment of the Company in 1821, Claims and of Profits allotted to the Assured has exceeded in Cash value 900,000l. which represents a sum total to every £100 assured of £300!
After the Division of Profits at Christmas 1859, the Life Assurances in force, with existing Bonuses thereon, amounted to upwards of 4,750,000l. the Income from the Life Branch 207,000l. per annum, and the Life Assurance Fund, independent of the Capital, exceeded 1,318,000l.
FIRE DEPARTMENT.—Insurances are effected upon every description of property, at home and abroad, on moderate rates.
No expense is incurred in effecting a New Insurance beyond the payment of the Annual Premium and Duty, when the Premium amounts to 5s.
Claims liberally and promptly settled.
Notice is hereby given, That Fire Policies which expire at Christmas must be renewed within fifteen days at this Office, or with Mr. SAMS, No. 1, St. James's-street, corner of Pall-mall; or with the Company's Agents throughout the kingdom; otherwise they become void.
Applications for Prospectuses and Agencies to be made to the Secretary.

Joseph Samuel Lescher, esq.	

SECRETARY—George William Lovell.
ASSISTANT SECRETARY—John J. Broomfield.
Insurances against Loss by Fire are effected by the Phœnix Company upon every description of Property, in every part of the world, on the most favourable terms.
The promptitude and liberality with which its engagements are always met by this Company are well known; and the importance of its relations with the public may be estimated from the fact that since its establishment it has paid more than Eight Millions Sterling in discharge of Claims for Losses by Fire
Insurances with this Company expiring at Christmas must be renewed within fifteen days thereafter, or they will become void.
Receipts are now ready at the principal Offices, Lombard street and Charing cross, and with the respective Agents throughout the United Kingdom.

MONEY on FREEHOLD and LEASEHOLD PROPERTY, by the MUTUAL LOAN FUND ASSOCIATION (Incorporated by Act of Parliament, 1850), 14, RUSSELL STREET, Covent Garden, W.C. Advances from 100l. to 1,000l. upon Freehold and Leasehold Property for any term up to ten years: Mortgages redeemed, and the advance can be repaid by easy instalments. Facilities afforded to tenants to purchase the houses they occupy, and the repayment of the advance taken as rent. Greater advantages are offered to borrowers than in building societies, there being no shares to subscribe for, or competition for an advance, and no deduction from the loan. No preliminary fees. Prospectus and forms of proposal sent on receipt of a directed stamped envelope.
EDWARD HARPER, Secretary.

ADVANCES are made by the SOVEREIGN LIFE OFFICE, 48, St. James's street, London, of sums not exceeding 1,000l. to Officers and other persons resident in England, upon their assuring and giving two sureties for repayment by instalments in three years, at five per cent. interest

POLYTECHNIC. — Patron: H.R.H. the PRINCE of WALES.—The Ghost Effects and Spectral Illusions, being Professor Pepper's adaptation of the original and most startling illusion of Henry Dircks, esq. C.E. The illustrated Fairy Tales, the Shadow Pantomime, the Christmas Tree, the Improved Chinese Fireworks. The Entertainments and Lectures provided this year are on the most liberal scale.
